I'm considering the purchase of a Maldol MK-30 series motorized antenna mount for my minivan, so I'm soliciting opinions on it. Although expensive (~$160), this mount looks like the ideal solution for lowering my antenna so I can drive into my garage without getting out of the vehicle and dropping the antenna manually somehow. However, I am curious as to how the motor will operate in the harsh Wisconsin winters where it often gets to -20 degrees F (if it will operate at all). Most likely I will be using a large (~60") dual-band antenna like a Maldol ARD-16 or Diamond SG7900 on this mount, so I also wonder if the motor will have enough torque to lift such an antenna out of, say, 4 inches of snow on the roof without stalling or jamming. I can brush off the snow if necessary, but if the motor binds or hangs up in the cold regardless I will need to consider some type of antenna mounting.

Anyway, any feedback on these mounts (good or bad) is appreciated. (Also any opinions on then Maldol ARD-16 vs. Diamond SG7900 antennas themselves). Please reply via email since I don't get to read this newsgroup too often.

Hello all,

can the at-11 tuner be modified to work in the 6 meter band?? I would like it to work with an ICOM IC-706 that covers 160 thru 6 meters. Or better yet, will it work in the 6 meter band as originally designed.

thanks in advance for any help

Its been my experience that many of the fuses and fuse holders cause
a significant voltage drop under higher current load, as much as 2 volts
or more. The lighter outlet has to supply 10-15 amps to the heating
element of a cigarette lighter.

A 30 watt amp is probably 60 watts input. That's only 5 amps at 12 volts,
less at 13.8 Volts. When current gets up past 20 amps I like to measure
across every connection to look for voltage drops.

Source record: 199780

I have been having trouble with the diodes in the MFJ 949E antenna tuner. About every month, both diodes go flat. I suspect that this might be caused by static electricity from wind blowing across my dipoles (I can hear sparks inside the tuner), but several other hams I know have the 949 and do not have this problem.

The diodes in the stock 949 are 1N34, but I also tried 1N4148, also with no success. It's kind of inconvenient to have to tear it apart every month to change the diodes! Any suggestions would be appre-ciated.

G'day,

Can anyone help me please with mods for the FT767GX HF/VHF transceiver. I am not particularly interested in the mods for transmitting on all frequencies, simply one that I have heard about - changing the standard 10khz per dial knob revolution to 5khz per rev.
Can anyone help please?
Thanks,

Peter VK5ZPG

> Paul...KE1FA
The 890 is a fine radio and the tuner will tune just about everything
including the bathtub. The problem with the 10 meter repeater may be
several things including being to far for direct wave and to close for
sky wave, A homemade vertical should help, as a test take some coax
rg8/x is fine skin the insulation off the top 8 feet or so and fold
the shield down the black covering so you should have roughly 8 feet
(7 feet 10 inches) of just the center conductor and the foam between the

center conductor and shield, dont bother to skin off the foam around
the center conductor and about 8 feet of the shield going down the
outside jacket, this will make the ant length about 16 feet total.
connect the end of the center conductor to a dogbone and tie it to
a tree branch or other convinent support and trging to keep the
antenna run as vertical as possible then run the remainder of the
coax to the rig. I think the fm repeaters are vertically polerized
and cross polerized antennas can suffer as much as 23 db of loss,
see if that dont help. also when engaging the antenna tuner try
turning the rig to cw mode and lowering the power out to 10 watts or
so and hit the tune funtion. Also take the g5rv antenna and throw it
tight in the trash as that is where most of them belong. you should
be able to put up either a full wave loop on the lowest freq you will
use or a half wave dipole at the lowest freq of use feed it with 450
ohm ladder line to your shack to a good 4-1 balun to your rig, you
will find it will tune anywhere with the internal tuner, but if you
should have a problem try adding or subtracting a few feed of feedline.
one of my antennas is a antenna cut for just below 7 mhz feed with
300 feet of 450 ohm and I use that antenna for 40 meters up including
the fm section of 10 meters, as a test of the ridiculus just to try
and see what the tuner will do I tried tuning that antenna on 80
and guess what it tuned so I tried 160 and guess what that also tuned
again, Now I wouldnt use a 40 meter zepp on 80 and 160 as the
arrangement would be inefficent and I have seperate antennas up
for 80 and 160 but the internal tuner matches better than any
outboard tuner I have tried. I recommend the 450 ohn 16 gauge
stranded line fromthe wireman I have over 1000 feet of the stuff up,
Its good and easyto work with, and use a good 4-1 balun not a cheap
piece of garbageand you should have plenty of fun, Good luch E-mail
and questions

Hello hams,

I have a Logimetrics model 925, 50kHz to 80MHz, RF signal generator for sale. This unit has a built-in digital frequency counter, which can be used seperatly within this range. RF level is adjustable from 1 microvolt to 3 volts. Modulation is adjustable at 400Hz, 1kHz, CW, and external.

This equipment was orignally used by the United States Coast Guard at its last overseas LORAN station, in Keflavik Iceland. It was within calibration (METCAL) standards as of March 19, 1995. It is very clean, and in perfect working order.

I resident in the New Castle, Delaware area. IF you would like to arrange to inspect the equipment, if in the local area, feel free to request so. All others pay shipping. I'm asking $250 or best offer.

Hi Nick,

I suspect the problem may very well be static discharge.The diodes do have
a path to the transmission line via a small capacitor.

I'd install an RF choke on the output side of the T network, from the
connector causing the problem to the chassis. There's little you can do
near the diodes to help, since the spark contains broad spectrum RF
energy, and that's what the diodes and directional coupler respond to.

Hopefully installing the choke (or perhaps a high value resistor) will
drain off the charge, and stop the arcing.

Ok, ok. But operating without all those "helper tools" is one great
way to improve your sending and receiving speed, especially those
guys stuck at the 7 to 10 wpm plateau. Good luck in the contest.

happy field day. Joe

Not very likely Dave, Since aircraft is AM and most 2 meter ham gear
is only FM (at least on Tx) the closest you might come is a 2 meter ht
that can recieve aircraft but not transmit. The only possibility
would be (I think) an all mode rig that could be opened up to cover
the aircraft frequencies but this would probably cost much more than a
cheap air band HT.
Best of luck

Make sure he is not using the 202 with a 12 volt power supply and the rubber duck(that includes 12 volt batteries) There is sometimes a problem with some signal bleeding back into the 202 when it is at full power @ 12v. It causes the PL to unlock. Also, make sure he doesn't leave the battery on when using external power, some older 202s fry when external power is used with the battery installed. Hope I helped.

3856. help me build .001 microhenry inductor (strip line maybe ?)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-11 00:00:00 UTC
From: VE4KLM <slmusr03@MBnet.MB.CA>
Message-ID: <Pine.SUN.3.91.960611093017.13502B-100000@access.mbnet.mb.ca>
Source record: 199668

I am building a 6th order butterworth bandpass filter for the 2 meter band (hoping to kill the intermod problem at my location), but some of the inductors are just too small to wind using conventional air coil designs. I have seen the use of strips of metal to do this, but I do not know the calculations involved. The ARRL book I have shows lots of projects using pieces of wire or strips of metal, but they do not tell you how to calculate the inductance.

Can anyone give me dimensions for a .001 microhenry strip, and also maybe some strip line formulas, so that I can create my own inductors.

Thank you very much,

Maiko

Salutations!

I've been licensed as a technician class operator since April. It was my neighbor who first got me interested in amateur radio and convinced me to study for my license. Unfortunately, he died in December leaving his widow, and an adult daughter, both of whom I am acquianted with. I would very much like to buy his equipment from them, and was wondering how I could tastefully go about doing this?

Thanks,
Josh - N3XGR

Hello All,

I just purchased my first HF receiver HR-1680 (need the speaker)and HM-102 meter(still need transmitter, amp,etc) I would like to set up a station with all Heathkit and or other assorted homebrew equipment/kits and would be interested in hearing from other Hams that have done the same. Specifically, I was wondering if Heathkit came out with a transmitter that would especially compliment the 1680. Also, I was wondering if I would be able to use one of the TENTEC 6mtr kits(20-6) with this rig.

Any tidbit(s) at all would be greatly appreciated.

3866. Another FT736R Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-11 00:00:00 UTC
From: dave eckhardt <davee@hp5800.desk.hp.com>
Message-ID: <31BDB381.3B2E@hp5800.desk.hp.com>
Source record: 199678

Of all weekends, the Spring VHF contest weekend! While I wasn't serious about making points, I discovered another problem with my Yaesu FT736R on all bands. To make the story a bit shorter than it could be: the low temperature Saturday night was near 45 (F). We were camping at our new home location in the foot hills west of Fort Collins, Co. I turned the radio on about 0930 Sunday morning - air temp now about 72. To my dismay, I found the radio would only operate on LSB and FM - not what I wanted for the contest. The USB and CW positions would not function. I have not had the radio cool in the year I have owned it. I assumed it might be a low-temperature turn-on problem with the USB/CW oscillator. This could be either low beta of the oscillator transistor, low crystal activity, or marginal feedback around the active oscillator circuitry. All of these would be helped by warming the radio up. I set it in the sun for about 45 minutes. Now everything worked. Has anyone else experienced this problem? Is there a proposed fix for this problem? This is now Yaesu design problem number six for me on their FT736R. Did they EVER test the radio under slightly depressed temperatures. I believe this is within the published specified operating temperature range of the radio! I will NEVER buy another Yaesu again - especially for the money they get for the '736R!!!

In addition: The LO (synthesizer) noise WHILE TUNING makes finding a weak signal rather compromised. Many of the synthesizer spurs which are not evident when not tuning the radio become rather disturbing when the radio is tuned. It makes looking for weak signals a stepwise discontinuous operation. Its OK for FM, but certainly is a compromise for weak signal SSB or CW operation. This would not be evident in a noisey city location, but is certainly disturbing with a quiet antenna location. What ever happened to the old Kenwood TS-700A technology??!!!

Remove the front panel of the radio - this is done by removing the
two allen head screws from the front panel and then pulling the
front panel off. Look on the PCB behind the front panel for a
single SMD diode near the 'W1' silkscreened on the PCB; remove this
diode.

Replace the front panel.

Note that this mod can be made without removing the actual radio from
the mounting bracket.

> there was a widely held shared view that the the Jews ought to be
> eliminated in some way from German society. When Hitler, ultimately,
> chose mass extermination as the only "final solution" he was thus easily
> able to enlist vast numbers of Germans to carry it out.It is certainly true, that lots of Germans actively (or passively) supported
Hitler and its regime, but the hatred against Jews and other minorities
(e.g. Gypsies) was not a German problem, but a problem found in all christian
countries. I think, the reasons why the whole thing went out of control,
is too complex to be discussed here (besides the fact, that it is off topic
here), so lets keep it out here.

> Of course those Germans NOT alive during World War II cannot be held
> responsible. But I refuse to respond to German "CQs" because I feel the
> mindset of Germans even today would allow a repeat of the holocaust if
> the only could find another Hitler. This was shown during the recent
> Gulf war when Germany was the one selling weapons and materials to make
> poison gas to Iraq.It was not Germany selling these weapons to Iraq, but German companies, which
illegally did this. German justice prosecuted (and still does) these companies.
To make responsible *the Germans* (and to say, they are just waiting for somebody
to do such illegal business) is an insult to all (and this is the huge majority)
Germans supporting a democratic System Germany is since the end of WWII.
It would be the same, if somebody just refuses to make a QSO with an American
station, because 'all Americans are racists discriminating black people'. Just
think about it, how long it lasted, until black people got the same rights as white
people in the USA. On which side did *You* stand in these times?
Although there are still ways to many of these brain damaged 'Arians' crying around,
there are not more racists in Germany (and Switzerland, and France, etc.),
than in USA. Just remember, where all this Nazi-crap showing up in Europe comes
from: It mostly comes from fuckers like Garry Lauck, which proclaim their crap as
'free speech'. As long as the USA (and Canada) is not willed to stop this abuse
of the certainly important right of free speech, I would suggest You to choose
Your words more carefully next time.

> Surely there are some caring decent German people that would resist
> another Hitler and another holocaust but there are too many Germans just

> waiting to finish what Hitler started.You are doing just what the nazis started 63 years ago: You are fiddling around with
history telling lies and changing facts to bend reality to what You want it to be.
Have You ever been in Germany and have You really found all but a few Germans
to be Nazis?
Or do You just tell us about Your fantasy, how You *think* the Germans are
(or have to be?).

> Is there anyone that agrees AND is willing to say so?No, I do NOT agree, and I do NOT accept, that somebody is changing history, just
because he is too stupid to understand it.

> I notice that hams rarely will stand up for or stand against anything.As You may have noticed, I stand up for a democratic system practised in Germany
(and Switzerland, where I live).
And I stand up for one of the most important things, ham-radio stands for:
Bringing people together, whichever color they have and in whichever country
they live.

just think about it.

Let me give you some idea why you do not find such a unit already on the market:

1. Build an RF power amplifier stage that is linear for AM and still 65%
efficient like Class C operation on FM.
2. If you succeed (the commercial folks have NOT), take that design and
build it to operate with no tuning from 108-148 MHz.
3. If you succeed, submit it for type-acceptance by the FCC and approval
by the FAA. Design mods for all hams who also HAVE to talk on their
local public safety frequencies up to 161 MHz!
4. If you succeed, find an antenna with reasonable VSWR and gain acceptable
to a ham over the entire frequency range.
5. Run a quick market survey to find out how many licensed hams are also
pilots who can afford to buy your radio.

A friend of mine is planning an around-the-world trip in a light airplane. He intends to install an HF transceiver in his airplane primarily for use in the ham bands but also as an emergency backup for long range communication with air traffic control. The aircraft is a Cessna 172RG which has a 28 volt electrical system.

The requirements for this radio are that it be small, light, easy to use, work well in an aircraft installation, and above all else be tough and reliable -- he'll be a long way from the nearest service center.

My friend is seeking user reports on the Icom 706, with respect to the above factors. In addition, comparisons to similar Kenwood or Yaesu units would be helpful. If you have such information, we would appreciate it if you would send it to me via e-mail at the address below.

Thanks for your consideration.

> handy test instrument. Thanks for any help! Please e-mail me.

No, it cannot. The HTX-202 is an amateur radio transceiver, not a signal generator. It was specifically designed by Tandy to NOT be capable of out-of-band operation.
As a commercial radio technician, you should already know that it is illegal to operate any transmitter that is not type-accepted by the FCC on frequencies where type acceptance is required, which includes Parts 80, 90, and 95. There is no exception listed in the FCC rules for technicians with "a handy test instrument."

Please come back to earth..... I don't know if you've ever been to
Germany but I think there are much more NAZI's in the USA and they are
allowed to carry heavy arms.Nazi propaganda is forbidden in most of
europe and in Germany for sure.

To say "the Holocaust didn't happen" makes you go to jail in Germany
so they know what happend, but I wonder if you do.

I don't like socialists because those governments spend too much money
but to say all socialists are fasists makes really no sense at all.

Remember you live in a FREE country unfortunately with a president
that can act as dictator..... I think Germany and Dutch governments
are much more democratic than the US will ever have.

What is a country that prevents CB users to speak with other
countries?

Enno

3884. T22A extended receive

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-11 00:00:00 UTC
From: Jonathan Kohn <leajen@paonline.com>
Message-ID: <31BE31F5.72B8@paonline.com>
Source record: 199696

Procedure to extend Icom T22A ht receive capabilities and ALSO to input frequence using all 6 digits:

Turn off radio.
Press and hold the B{MR} and {^}{scan up}.
Turn on the radion and continue to hold these buttons for 5 seconds before you release them.
Now go into the set mode {FUNC+(8)} and look for the new function called 1 PLACE.
Adjust the main tuning knob until you see 100 PLACE and press the clear {VFO} button.
Now the radio will have wide receive including aricraft and 6 digit direct entry.

Burt Fisher wrote:
>
> the holocaust to take place. The author shows the ingrained deep hatred
> for Jews that Germans had for Jews before Hitler came to power and that

Just a few facts, and I wonder, if you could figure out the WHY..

(1) Did you ever notice, that most people of the jewish faith have uniquevocal GERMAN names? Did you ever waste a thought, why that may be this way? Rosenzweig, Goldstein, Goldhagen ... all these names make sense, when you look them up in a German->English dictionary.

How comes, that just those surnames, that are deemed "to be jewish names" are actually German names?

How can that be, if "the ingrained deep hatred for Jews that Germans had for Jews before Hitler" were fact and not fiction?

Wanna know the answer?

The answer is, that Germany before those dark 12 years had been among the most tolerant and most liberal countries in this world. People persecuted in other countries for their political and/or religious beliefs not only went to America, more often than that they went to Germany.

(2) Germans understand Yiddish, the majority of jewish people understand German..... How comes?

The answer is:

Yiddish is just a German dialect, though quite a number of jewish non-Germans possibly might see it differently. But then "Yiddish" derives from "Juedisch", which is German for "Jewish"...

(3) After the spook of Nazidom had ended, a considerable number of Germans, who fled Germany for their jewish faith, returned to Germany. Why would they return to the country of deeply ingrained hatred against them???

Do you know the answer?

Germans they were before those twelve years, Germans they remained in their hearts even abroad. They simply loved their country Germany, though for you, Burt, "being German" and "being Jewish" might seem to be in opposition to each other,...

But then, it is just a fiction created by the Nazis, and carried on
by potential Nazis like you. With the mindset that you display, Burt,
you would have fitted the Nazi requirements exactly. "I was told so"

"German" is a nationality and an ethnic background.
"Jew" is a reference to a religious creed.

In World War I, lutheran Germans, catholic Germans and jewish Germans
fought and died side by side in the war fields of Flanders and around
Verdun. And nobody gave a damn about their religious beliefs. They all
fought as Germans. Period.

Putting "German" and "Jewish" into opposition,
is like claiming "American" and "Catholic" were in opposition....

> there was a widely held shared view that the the Jews ought to be
> eliminated in some way from German society. When Hitler, ultimately,

Widely held shared bull shampoo...

> > Of course those Germans NOT alive during World War II cannot be held
> > responsible. But I refuse to respond to German "CQs" because I feel the
> > mindset of Germans even today would allow a repeat of the holocaust if

The mindset you describe, Burt, is your own mindset. Unfortunately, it
has some blockheads of that mindset in Germany, too. But believe me,
they are just a minority like you are in the USA.

> > the only could find another Hitler. This was shown during the recent
> > Gulf war when Germany was the one selling weapons and materials to make
> > poison gas to Iraq....

(a) It was not the German government, but criminal personalities in some
German companies.
(b) It did not happen during the Gulf War, but before
(c) Iraq had no weapons that were sold to it by the GErman government.
Actually it had nofunctioning GErman weapons at all, neither legally
sold one nor illegally sold ones.
(d) Iraq sported quite an arsenal of American weapon, given to it free
by the U. S. Government earlier, when the fear of Mullahs prevailed
in Washington and led to a total misperception of who Saddam Hussein
might be.
(e) The crooks in Germany were prosecuted and serve jail terms.
(f) Any idea, what happened to the crooks in Washington?

> > Surely there are some caring decent German people that would resist

There had been some. I would want you to visit the Dachau concentration
camp near Munich, and please, take an interpreter along with you. There
were Germans, who resisted in the bureaucracy, who dared investigate and
initiate prosecution of the Nazi murders ... and who in turn were murdered
for thei civil courage, too.

3893. FT-50 scan question

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-11 00:00:00 UTC
From: kjsmith@violin.aix.calpoly.edu
Message-ID: <4plo7o$1nuh@violin.aix.calpoly.edu>
Source record: 199705

I'm itching to buy one of these things, but still have a few questions...

1) I want to scan a mix of VHF and UHF frequencies. Will it scan both,
not mattering what band the channel is in? I'm hoping for regular
"scanner" type scanning.

2) I want to check a UHF channel for activity very regularly while
scanning. Is the priority (or whatever Yaesu calls it) fast enough
to prevent me from missing calls? (I'm used to Motorola's which
sample 1-2 times per second or faster)

3) While scanning, I want to be able to hit PTT on the radio (or speaker
mic) and have it always default to a particular channel (eg: my UHF
priority channel). Will the radio do this?

4) What's the story with the FTT-12 keypad kit and DVRS? Is this a simple
addition? Does anyone know if Yaesu will be selling the radio in a
model pre-configured with DVRS? It seems silly to buy the radio, and
then buy a $64 keypad upgrade, rather than just saving money at the
outset and getting the keypad I want.

5) Is anyone making aftermarket batteries for this thing yet? I checked
Periphex, and I don't see anything. I hate buying OEM batteries, as
they're always less capacity for more money.

6) Anyone know if there is a soft case for the larger batteries? I'd
shine NiCads and use the AA case, but I want a full 5w of output power.

7) Does the mic adapter allow me to use older speaker-mics with the radio?
It's described as a two-pin to one-pin adapter, so I'm assuming it makes
the multi-connector Yaesu plug into a separate ear and mic jack
(hopefully so I can use my Icom 02 series headsets/speaker-mics).
Has anyone attempted to get just the 4 conductor plug with cord (ie:
speaker-mic replacement cord) from Yaesu parts?

8) Are the 112 memory channels "true" memory channels, or does this include
things like call channels, scratchpad, search limits, etc?

Also, anything specifically you don't like about this radio?

Lots of info that Yaesu doesn't provide on their web site or in the
brochure. Any help would be appreciated!

I believe the sentiment of most falls in line with the old expression
"It's the way it's always been - I don't wanna change!"

Eventually, although regrettably, I also feel that hams will feel the
pinch of technology sueeezing them ever higher in search of usable
spectrum. However, I also feel that existing spectrum resources can
be more efficiently utilized by projects such as LEO.

TSQL= tone squelch (a subaudible tone is required to open the squelch in
receive)
T= tone encode(the subaudible tone that is required when you transmit to
open the squelch on the repeater receiver.
If you push FUNCTION,then TSQL you will notice that the small display
changes from T,TSQL....T.....blank...T,TSQL etc. Sounds like you want to
set it for "T" so that it will be encode only.

Also, when I key-up a
> repeater on some(not all) of my memory stations (with the tone encoder
> activated), I can't hear the repeater come up & then shut down although
> I can see the receive light light up and the S-meter indicates proper
> reception of the signal.
>
This is normal if you improperly set your radio for TSQL. The LIGHT would
be on because it sensed a signal but would not pass audio because it did
not contain the PL tone or subaudible tone to allow audio to pass. Again
set yo radio for "T" or blank in the case of a carrier access repeater.

>73,
>Ken, W4OFE

Hi, Ken

Sounds like you might not be familiar with a subaudible tone DECODER. The Z1A has both an encoder and decoder. When you turn the ENCODER on (just a "T" showing in the display), the radio transmits a tone. When you have the DECODER turned on ("T SQL" showing in the display), the radio requires that the station you are listening to is sending subaudible tone (and the tone you've programmed the radio for) before the squelch will open and you'll hear anything. It also transmits the tone in that mode.

And when the radio is in "pocket beep" mode (T SQL))) in the display), it will ring like one of those new electronic phones when it hears a signal with the right tone.

Did that get it?

Source record: 199794

Yes,

I have a Standard C508A. 2M/440 xcv, plus 900 and 300Mhz rcv. It's small and cute. I've tried it on 2 meters, and it can get in to a repeater ~ 10miles away if you are in a clear spot. (Power is about 200mw). I've gotten a few miles on simplex.

The small size means features are accessable by multiple button pushing. I've learned a few, but there are many.

I like it because it's so small I can take it anywhere, and I don't need DTMF.

>FYI: The socialist part of Germany was discontinued a few years ago.

I think you and WB3U are using equivocal terms in English. Unlike the German usage, in English, "Socialist" can and usually does refer to social democracy. This probably comes from the usage of the Fabian (social-democratic) society in England. When one is referring to a Marxist movement, one usually simply calls it "communist" or tacks on the appellation "Marxist" as in "Marxist Socialism." Thus, the demise of the DDR and the SED are irrelevant to the post above.

On the other hand, while the SPD (a "Socialist" party in English) certainly has a lot of power and is responsible for many German policies (the better ones IMHO), it is only the number two party at the moment and, contrary to what WB3U said does not "govern" Germany.

Furthermore, WB3U's idea of equating National Socialism with either Social democracy or Marxist Socialism is utterly laughable. While the original NSDAP (National Socialist German Worker's Party or Nazis) as founded by Anton Drexler had some elements of Socialism at the beginning and the Sturmabteilungen (SA or "Stormtroopers) were recruited from the working class with promises of a more equitable future, the fact remains that the NSDAP was the avowed enemy of social-democracy and Marxist socialism alike.

After the SA had served its purpose, it was disbanded and its leaders executed in the "Night of the Long Knives" on June 30th, 1934. The unions, bulwarks of socialism demanded that the NSDAP honor workers by making May, 1 (workers' day) a national holiday. Hitler agreed they forcibly disbanded the Unions the next day. Other seemingly socialist policies supported by the NSDAP such as the "Strength Through Joy" program, for which the Volkswagen was created, were only used in propaganda and never actually put into practice. Finally, National Socialism violates the cardinal principle of both democratic and Marxist Socialism, "the nationalization of the means of production." Under the NSDAP, the factories remained in private hands and made a profit. Thus, ironically, Marxists see Nazism as an extreme form of CAPITALISM! WB3U's post could have easily been posted by a Marxist as long as he did a simple "search and replace" exchanging "Capitalist" for "Socialist!"

Source record: 199798

I have read a few post regarding the programming kit for the ft-50r but HRO says it hasn't been released yet. What gives? Anyone?

Also, I would liek to hear from folks who have a curios ticking on the rx end in 153.xxx range. My radio will tick as it scans, but not stop the scan or open the squelch completely. Is it picking up a weak signal or something? It is happening mostly on a local police dep. channel. Would the CTCSS tone keypad cure the problem, assuming I used the PD's pl tone.. ?

One more note. In general, thanks to everyone that has posted or replied as I try and get a handle on all this radio stuff. I've learned quite a bit with your help!

-Cheers
Rob.

As you will discover if you persist in this debate, saying it
and proving it are two very different things.

>If this is the stupid taxation is theft argument, then
>every democratic government in the world that imposes taxes,
>including the USA, must have a fascist government.

This seems to be a reiteration of what I've been saying.
Unless you agree with me, you should consider rephrasing
your statement.

>> As to the new parties, they are related to the old by
>> their continued inability to divest themselves of the
>> aforementioned characteristic.

>Socialist goverments use exactly the same laws as every
>other form of government to make people pay taxes, etc.

Are you saying that because many governments do this, it
must be morally correct?

>> Ultimately, all socialists are fascist and all fascists are
>> socialist. The distinction between the two is solely a
>> matter of perception.

>This is just plain wrong. I don't know whether from
>ignorance or design, but socialism is NOT fascism.
>It's not a matter of perception, it's a matter of fact.
>Socialism, if anything, is the opposite of fascism.

Nyet, Robert.

Socialism and fascism both subjugate individual rights to
the state. They both replace those rights with limited
privelages. Both use force to subdue citizens who attempt
to exercise their rights in contradiction to the state's
claim that they don't exist. Both contend that the whole
is more important than the individual. Both operate on the
premise that the end justifies the means. Both steal from

those who own, and from those who earn.

I'm sure you can tell me which of these you disagree with?

>Equating socialists with nazis is a lie worthy of Joseph
>Goebbels himself.

You keep talking about lies, but you haven't presented
any logical basis for that claim.

>The Nazis are not, were not socialists, they were fascists
>who spent a good part of the thirties and forties murdering
>socialists whereever they could - like Spain, for example.

Socialists have no morals. Given the power, they'll murder
anyone in the name of the state, including other socialists.
Of course, some socialists only have the power to lie, cheat
and steal.

>Calling themselves National Socialists didn't make them
>socialists any more than Communist East Germany was Democratic
>because they called themselves the German Democratic Republic.

That's a good point. You realize that East Germany and the
Soviet Union were both socialist, right?

>There have been socialist goverments in Britain, Holland,
>Sweden, Australia, New Zealand, and many other countries.
>None of them have ever been accused of behaving like Nazis
>with the slightest credibility.

It is my considered opinion that overt acts of public mass
violence are not required in order to accurately describe a
government as fascist.

>As the son of a father who fought real Nazis while in the
>Dutch underground, and a mother whose family concealed a
>Jewish family in her attic in Utrecht for 2 years while the
>Nazis and their allies hunted for them - I and my family
>know what Nazis are, and the difference between them and
>socialists.

My family members also fought the Nazis, although their
acts don't compare with the courage of your parents. You
can believe me when I say that I have the utmost respect
and admiration for what your parents did.

Let me ask you a few questions, Robert.

1. At what point in the denial of individual rights by
government do you believe that socialism changes to
fascism?

2. Do you believe that violence is required to fulfill
the definition of fascism, and if so, how much?

3. Do you believe that democracy, in and of itself, prevents
fascism?

>You are either woefully ill-informed or a terrible liar.

Actually, I AM a terrible liar. I've never been any good at
it at all.

Message-ID: <834477319snz@g3vsh.demon.co.uk>
Source record: 199801

Hi
I wonder if anyone has used the Icom 706 multi-mode 80-meter to 2-meter transcever without sight successfully? I know it should be possible with a speech synth through the computer interface, but I'd also like to know whether the rig can be used on its own (for mobile work) without help. My concern is the menus, as the frequency, mode and signal strength are given by the (optional) voice synthesiser.
Any comments or help on this or relevant software welcomed.

I am buying a radio for use on my power boat. I am considering the Yaesu FT-900AT, because 1) it has a detachable head, 2) it has an internal antenna tuner (the KW TS 50 does not)
; 3) from what I've understood, it doesn't have performance compromises as does the Icom 706.

I would very much appreciate comments on the FT900AT from any and all, and thoughts regarding the relative merits of small rigs in this class for use on a small (25 foot) cruiser. I was planning to use the radio in conjunction with the Spider multiband antenna.

I didn't read the article but depending on the mods, the 2600 RF stage
is essentially the same as the 2510. I've owned and worked on both.
The controller board is a little different on the 2600 as it
incorporates programmable CTCSS encoding and has a different micro
that offers repeater split offset. I suspect the mods apply to the main
board which should be applicable to both models.

Hi Tom-

Quite a fine post! It is indeed interesting to read the ad copy that talks all about how "brutally tough" all these tuners are, and then see the wimpy components in some of them.

I guess part of it is that I have seen and worked with genuinely heavy duty antenna matching components in the broadcast field.

I keep an MFJ 986 around for a quick matching solution when a situation pops up, but for normal operation on 80 and 160 meters I use home built, custom designed L-networks that are optimized for the partucular antenna I use on each of the two bands, and built using 10 KV + vacuum variables and Gates and Cardwell ribbon inductors. It is nice to be able to hit those networks with some power and not have to worry about a meltdown. <g>

I have seen the ads for the new MFJ 989C tuners that have the new air core roller inductor. Looks pretty good in the picture, but I have not seen one up close. Seems like it really ought to be an improvement.

Don't you think that some of these tuners oughta be in a bigger box? So that the inductor is not slapped up against the metal sides/top/bottom, like it is in the 949E (etc)? That's one thing I like about my L-networks: they are built open-frame style, on a wooden shelf. No metal around the inductors at all.

Thanks again for the good post on the T-networks. Well written.

I got the opportunity to measure one the other day. The Q was nearly
double the Q of the old OEP roller inductor that is the amateur industry
standard roller. Not only will it have 50% less heat under the same
conditions, it will dissipate heat better since it has free air
circulation.

>Don't you think that some of these tuners oughta be in a bigger box? So

That's a good idea. The sheetmetal kills a coil. I can't understand why
manufacturers jam coils up against the sheetmetal. Two coil diameters
would virtually divorce the coil from the chassis.

Sometimes shielding isn't important, sometimes it is. Someone being driven
nuts by RFI brought his whole station down here, he had an expensive $1000
"top of the line" tuner and an expensive TVI filter in the system.

Neither piece of equipment had the covers grounded correctly, both had
plastic washers and paint under the screws. I could light a 12 v light
bulb near the edge of the tuner case, and my RF sniffer went wild near the
TVI filter (BTW the $100+ TVI filter had almost no attenuation above 70
MHz, since it was made with toroids and wire lead disc caps).

Grounding the tuner case to it's chassis (the tuner needed more screws
added) reduced case radiation by almost 45 dB and cured the RFI ! The TVI
filter was simply thrown away.

Well if you define the term "socialism" as "perverse thieve and extortionists," then the Nazi's were certainly "socialists." However, please realize that this is a highly idiosyncratic definition.

3924. Re: Separation Cable for IC-7

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-12 00:00:00 UTC
From: clinton.peebles@saloon.bcbbs.net
Message-ID: <960612053935126 28@saloon.bcbbs.net>
Source record: 199569

```
>e. Is this what Icom does typically? Is anyone else out there waiting for
>the
>ir cable?
```

I am. I e-mailed them and was told there was about a 1 month backlog.
That was about a month ago, so I expect to see my cable soon. At
least, I hope before summer is over.

 QMPro 1.53 I'd give my right arm to be ambidextrous..

3925. IC-Z1A - expanded rx ??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-12 00:00:00 UTC

Message-ID: <4pmf7b$2hs@vidiot2.corp.es.com>
Source record: 199570

I friend of mine asked me to post a request on how to
get his IC-Z1A to get into expanded rx on VHF and UHF.
He isn't able to find it in the book (or is it not in
the book ?). Email to hcooper@corp.es.com

73's and thanks in advance

-Harrison

IN MY OPINION - THAT WHAT YOU CALL "HOLOCAUST" CAN HAPPEN EVERWHERE -
BUT THE CIRCUMSTANCES OF THE REAL HOLOCAUST GENERATED THE WORST POSSIBLE
SCENERY..(IN GERMANY)
IN MANY CONTRIES, FASCISM IS COMMING UP - THIS CAN BE RELATED TO MANY
ACTUAL - PROBLEMS - ALSO THE NEW KIND OF POORNESS

YOUR TEXT CONTAINS MANY PREJUDICES - AND REFLECTS IN NO POSITION CURRENT
MOVEMENTS IN GERMANY -

IF I LOOK AT LEGAL (NAZI - or MOREPOWER(WEAPONS)FORTHEPEOPLE)-Organisations
in the U.S. - I`m very HAPPY, that there are no equivalent movements in
europe - (that I know)
I`m also very happy that none of my neighbours stores weapons in their
basement. 8-))

PLEASE DON`T POST SUCH SHIT HERE - PREJUDICES ONLY GENERATE OTHER
PREJUDICES

HOLOCAUST ALSO HAPPENED BECAUSE OF PREJUDICES

3927. SB102 manual wanted / HTX 212 mods?

On 6/10 I spoke to Sharma at Icom in Washington state, and the cables are on
back order, should be in soon. (It took three phone calls to get an
answer on why I had not heard anything). The Suzanne Adamson referenced
in the ads no longer works for Icom, which probably increased the delays.

This is caused by excess RF getting into the radio and unlocking the PLL. It is most often encountered when operating off of 13.8V using a rubber ducky. Solution: Use an off-unit antenna when operating from automotive voltage. (Using an aftermarket 8-cell battery pack can also generate the conditions necessary for the error.)

First of all, I am really astonished to find such political topics
in these newsgroups!

Whatever you feel, ethically, politically or whatsoever:
don't blame people globally in that nasty way!

> The best selling book, "Hitler's Willing Executioners" by Daniel Jonah
> Goldhagen tells the story of how ordinary Germans (like hams) allowed
> the holocaust to take place.

Ordinary people like hams?
What does political practice, murder, slaughter have in common with
a hobby like amateur radio?
Do you have statistical material about the corelation of being engaged in
a certain hobby and the partizipation in crime?

> But I refuse to respond to German "CQs" because I feel the
> mindset of Germans even today would allow a repeat of the holocaust
> [mess stripped of]

Amateur radio is the only hobby to communicate freely, worldwide and personally!
Please bear in mind that most of the hams are thinking that way.
Political aspects, ethical discussions and moral disputes have nothing
in common with our hobby.
If you cannot handle that, you MUST refuse contacts with a lot of countries.
Would you think about chinese brutality when working Spratly?

> Surely there are some caring decent German people that would resist
> another Hitler and another holocaust but there are too many Germans just
> waiting to finish what Hitler started.

Why do you think so?
Only by reading a book?
Open your eyes, you are more than 50 years too late!

Kirk James Smith wrote:

> 1) I want to scan a mix of VHF and UHF frequencies. Will it scan both,
> not mattering what band the channel is in? I'm hoping for regular
> "scanner" type scanning.

Yes. You get 100 memories that can hold any frequency. Unfortunately,
it doesn't separate them into banks so you have to scan all or nothing.

> 2) I want to check a UHF channel for activity very regularly while
> scanning. Is the priority (or whatever Yaesu calls it) fast enough
> to prevent me from missing calls? (I'm used to Motorola's which
> sample 1-2 times per second or faster)

The FT-50R supports something called "Dual Watch" which works similarly
to the "priority" function on scanners. However, I don't think it works
while scanning, only while listen to two frequencies.

> 3) While scanning, I want to be able to hit PTT on the radio (or speaker
> mic) and have it always default to a particular channel (eg: my UHF
> priority channel). Will the radio do this?

No. It will simply stop scanning.

> 4) What's the story with the FTT-12 keypad kit and DVRS? Is this a simple
> addition? Does anyone know if Yaesu will be selling the radio in a
> model pre-configured with DVRS? It seems silly to buy the radio, and
> then buy a $64 keypad upgrade, rather than just saving money at the
> outset and getting the keypad I want.

Yes, it's simple to add. I don't know about the other questions. The DVR
works great and you can split the 20 seconds up into two unequal parts if
you want. The VMPS in the manual does not work as described.

> 6) Anyone know if there is a soft case for the larger batteries? I'd
> shine NiCads and use the AA case, but I want a full 5w of output power.
>

The only "case" I've seen is a rubber thing that goes around the radio which
makes it easier to hold and protects it when it hits the ground. The AA case,
even though thick, doesn't support the full 5 watts output (according to the
manual). This is probably due to the available voltage.

> 7) Does the mic adapter allow me to use older speaker-mics with the radio?
> It's described as a two-pin to one-pin adapter, so I'm assuming it makes
> the multi-connector Yaesu plug into a separate ear and mic jack
> (hopefully so I can use my Icom 02 series headsets/speaker-mics).
> Has anyone attempted to get just the 4 conductor plug with cord (ie:

> speaker-mic replacement cord) from Yaesu parts?

The radio has a single jack for speaker/mic/data. It's a 4-conductor "phono"
style jack. I've heard of people who have tried to order a connnector and
haven't found a source. Yaesu makes an adaptor that lets you plug in
older Yaesu mics.

> 8) Are the 112 memory channels "true" memory channels, or does this include
> things like call channels, scratchpad, search limits, etc?

You're right. You get strictly 100 channels for regular memory slots.

> Also, anything specifically you don't like about this radio?

Some people don't like the dim-ness of the lit display. I haven't found it
to be a problem since it it's really dark, you'll have no problem seeing it.

I wish there was a way to turn off the beep that occurs when scanning stops on
a channel, but keep the beep for key presses.

Otherwise, this is the nicest piece of equipment I've ever owned.

That and also check for a cold solder joint around the 8V regulator
inside the the top cover on the right side of the chassis...this 8V
regulator supplies B+ to all stages of the rcvr and transmitter..on TX,
any high resistance will cause the 8V line to drop to a LOW voltage and
the PLL will unlock, causing the display to go out (thats the unlock
warning)....If the relay is high resistance on the 8v switch side, the
same condition occurs...on my 227R it was due to the 8V regulator though
being flexed too much and cracking the land on the bottom of the PC board
and led to a high resistance in the 8v ckt to the TX...

But I have seen the relay also cause problems.....

The sensitivity is not anywhere near that of the Optoelectronics units. However if you are just looking for something to check the freq of a relatively high strength signal it's not bad for the money. You might want to wait a bit longer though, RS is going to have a replacement soon with better sensitivity and more features. My guess is they will drop the price to clear out the old ones. In case you're wondering how I know, I was one of the engineers on the first counter. Tandy pretty much closed down our group, but there are two engineers left and one of them was working on the replacement last I heard.

Why don't you attack this thing just like the rest of us. Buy the text books from either American Radio Relay League (found in amatuer radio stores) or from W5YI (found in Radio Shack) study them and then find a friendly amatuer radio club in your local area that sponsors test sessions.

You can test all the way from "novice" to "extra" with comminsurate previleges granted and recognized from the FCC.

Just 'cause you buy the books and study doesn't mean that you are authorized to transmit!! Remember - you gatta' have a liscense.

Good luck! With a little more effort you could try for Tech+ right
away ...

>I want something that will grow with my needs as I upgrade but "all-band"
>transceiver's are just too darn expensive!

Amen!

>I've seen 80-10mtr Transceiver's but they don't go down to 2mtrs and if I upgrade licences
>immediately I will have outgrown my rig.

I don't know your budget, but you could find a nice Kenwood TS520S for
$250 to $400 (depending on accessories) or a nice Yaesu FT101 in the
same ballpark ... for 2m, a simple HT will do in most areas, and are
available from $150 used ... HF antennas are just wire, and will cost
you less than $10 to build (and less than 30 minutes work!).

73 and good luck!

I have seen this problem with my 202 but only with the BP-84 battery pack and the rig in the high power mode. Has the Shack ever come up with a fix for this? Does it occur even in the curren production models? I like the HTX-202 enough that I would consider getting another one if my son gets his license. Good solid radio and I like the user interface a lot. But I would have to rethink that if Radio Shack is not at least trying to fix what is obviously a design error. It would be a shame if they let this flaw ruin what is otherwise an excellent hand held.

>IMHO your best value would be the Alinco DJ580t.

Is that true about the Yaesu FT-50R? I read here, the Icom T-7A was a good dual HT. I never had or knew anyone with good luck using Icom marine gear, five or six different units. If anyone could report on their HT, without the oversell of the advertising! Does any HT do full duplex? Can be used as a remote control for a mobile? Is meant to be used as a primary rig with a docking station for car and home use? I need input, waste part of this Sunday to tell about your HT. Thanks,
With good thoughts,

Just checked my HTX202 for this error when using higher voltages and it
seems that the problem has been resolved. My HTX is about two weeks
old or I should say that I bought it about two weeks ago and is behaving
itself very well. The manual states that the er-2 is a PLL problem and
that
should be chacked out by a tech. Take that for all it's worth! 8-)

> Great rig! Wouldn't let mine go. Its small size results in my carrying
> it lots of times when I wouldn't take a bigger handheld.

I assume you mean the C-508A...

I own one also... The rig is most useful if you are near a repeater or use it for simplex over 2-3 miles (maybe 3-5 miles, depending on the terrain). Remember, this rig only puts out 250-280 milliwatts with two AA batteries.

I have used the rig as a backup rig for 2 meters. It was useful when my Kenwood was in the shop for repairs (does everyone have a Kenwood rig that has been returned to the Kenwood factory for repairs?).

For sure, the Standard supplied antenna should be trashed except for all of the shortest contacts anticipated. I have used the rig a lot for longer distance QSO's on 2 and 70cm with no problems, using an external (mag mount) antenna, 1/4 wave and or 5/8 wave antenna. Hams with beams should get even better results... remember it's only .25 watts!

I have also had good results using the Comet SMA-3 antenna for reasonable distance (i.e. to not to far) repeaters or simplex stations.

> many silly bells 'n whistles. The Icom 706 is nice, but approximately
> $400 more expensive, and much more complex.
> 73 de KC5NG

Totally agree with Dean...the Alinco DX-70 is a fine mobile rig.
As an owner of an FT-890, an IC-706, and a DX-70, I believe the
combination of ergonomics, price, performance, and size put the
Alinco at the top of my list for MOBILE operation.

The 890 still wins as a fixed station compact rig, and the Icom
is nice due to the full 2M and 6M band coverage. But, the Alinco
is very nice when used mobile.

Here are the shortcomings of the Alinco in my opinion:

1. NO built in VSWR meter
2. No built in CW keyer

Otherwise, a superb rig with an exceptional receiver and great
CW and SSB transmit. I use mine as a travel rig too and it's
quite durable and light-weight.

3973. Yaesu FT747GX trouble

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-13 00:00:00 UTC
From: dslosty@usa.pipeline.com
Message-ID: <4pog71$kch@news1.t1.usa.pipeline.com>
Source record: 199415

I've got a Yaesu FT747GX HF transceiver with a problem
that's been difficut for me to solve.

Periodically, on any or all modes, the relative RF output
meter will pin and the actual RF output will drop to near
zero - at least on the indicated frequency. It's very possible
that the radio is putting out wideband garbage when this happens.
By the time I get in to start 'scoping around, the symptom
disappears and the radio works fine. I often use the radio for
pactor communications, so when the symptom occurs, I loose
the link - very annoying.

Any ideas?

I am trying to help a friend who has a heathkit SB 401.
We need the schematic for the 9 pin power connector.
Any help would be greatly appreciated,

Thanks, Bill

3975. ft-51r mods

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-13 00:00:00 UTC
From: a71213@netrunner.net
Message-ID: <31c0814d.26701107@news.netrunner.net>
Source record: 199417

It was always believed the newer radios (post cell ban) were to be built without 800mgz. It has come to my attention lately, this might not be the case. I would be interested to get any information on the mods for the ft-51r. If any one could help me it would be appreciated.

3976. ft-51r mods

Newsgroup: rec.radio.amateur.equipment

It has come to my attention that mods for the ft-51r exist which surpass the ext. tx. I would be interested if any one who has experimented whith these could post them, I will do the same when I find some.

3977. Invitation Free FTP site available to host your work

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-13 00:00:00 UTC
From: ccadic@lenet.fr
Message-ID: <4pndtl$nv7@mordred.cc.jyu.fi>
Source record: 199611

Hi all.

We have designed a site dedicated to radio in general.
We own a FTP space of 100 Mo to host any kind of file.

If you have made a FAQ (In any language) that you would like to be
available to all internet users, we offer to host it freely.

This to start and build the most complete TXT site dedicated to radio
on the internet.

Conditions:

1 You FAQ or TXT (MODS, EXPLANATION OF A RADIO TOPIC,
EXPERIENCE....) must be YOUR writing
2 The texte must be signed and younger than 1995 (or its update)
3 You can add URLs to contact in your text. It'll be great if you can
add a link to our site in your WEB page.
4 Your text or faq should be ziped to gain place.
5 Your tex should be sent to: ccadic@lenet.fr via e-mail attachment
for control and installation onto our FTP site.

That's all.

Yours

Why do you need 2 wire to 4 wire conversion; what kind of repeater
setup are you thinking of?

In so many cases you can totally ignore line eq and simply bridge
each side of the 4w right onto the 2w (watching impedances, of
course).

Will this cause a problem?

3980. KENWOOD R2000 FOR SALE

3981. FT-50R features that aren't.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-13 00:00:00 UTC
From: dddavis@atl.mindspring.com
Message-ID: <4po0li$2n4o@mule1.mindspring.com>
Source record: 199615

I still like my FT-50R HT, but the list of features that do not work as advertised keeps growing.

1. Wide band FM is not really wide band for FM broadcast. Yes, I know that Yaesu now uses the term "standard" instead of wide, but the manual and their earlier ads clearly stated this mode was for FM broadcast reception, among other things.

2. Voice mail paging system (with the FTT-12 keypad) does not work as described in the manual. You can partition the memory and record a message for response in paging answer-back mode. However, the radio will play back the wrong partition. It seems like that if Yaesu's engineers in Japan tried this feature even ONCE, they would have seen it doesn't work. This is not a difficult bug to find.

3. The paging answer-back mode (whether using voice mail or not) does not answer if I speak for more than a couple of seconds after the page is sent. I would appreciate other comments on this if anyone has them.

NOTE: The guys in customer service for Yaesu in CA have been very nice, etc. They are in a tough position, I know. Anticipating one response to this post...I don't want a refund - I want the radio I bought to work as advertised. Why are there so many problems in this radio from a market leader? Thanks for letting me get this off my chest. :-)

Sounds like you have the encoder confused with the decoder. When you
have only the T displayed the encoder is engaged and will work like
you are wanting it to. When you are displaying the TSQL you have the
decoder engaged and will only hear someone else's signal if they
transmit the correct PL tone.

> Does anyone know if the RS frequency counter is any good? How does it compare to say, the Optoelectronics' Cub/Scout??? Tnx! David N4ZGT.
>
The RS unit is simply a no frills frequency counter. For $100 it is OK. Mine works fine. It displays a frequency for the duration of the transmission. If you miss it, it is gone. The Scout is a top of the line "Oh-my-gawd" piece of equipment. It logs frequencies into memory, and keeps track of how many hits on each frequency. It can program certain radios (AR8000) and do other neat tricks. It costs more than $300 (I think.) Check out Opto's home page for better details.

Which one you want depends on your checkbook and what you want to do with it.

>thanks bill bfurno@hunterlink.net.au

In my truck, I installed champion truck plugs wthat have a high RFI rating, supposed to radiate less well they work my 706 is now real quiet. Also I have a 11,000 35 volt electrolytic cap attached to the alternator output and battery ground. I put a 15 amp fuse in series with the cap. Truck is entirely bonded with 5/8 inch copper braid, where I used a dremel tool and burnished off the paint, star washers between the bonding braid and body parts bonded, all bonding attached points are serviced regularly to keep rust away and treated with a no oxide compound. the work doing this pays off, no noise using a 706.

>Mike
>--
1. Turn off the radio.
2. press and Hold the B and # buttons while powering up the radio, continue to hold these 2 buttons for 5 seconds after you power up the radio, then release the buttons.
3. Go into the set mode and look for a new function " 1 PL " . Adjust the main tuning know until it reads " 100 PL ".
4. Press clear and have fun.

The B and # does a soft reset to the CPU allowing tuning and switching to the aircraft frequency range and receiver frontend and detector. The change to 100 PL allows for 6 digit direct frequency entry.

Turn off the radio.
press and hold the B and # buttons while powering up the radio, continue to
hold the buttons for 5 seconds after you power up the Z1A. Now look in the set
mode for a new function labled 1 PLACE, adjust both tuning knobs umntil you see
100 100
PLACE
in the display. You now have the open receiver with 6 digit direct entry.

My definition is objectively derived from socialism's primary
mandate - economic control and regulation. Socialist governments
take earnings and other property without permission of the owners.
That's theft. Compliance is achieved through the threat of force.
That's extortion.

If my definition is idiosyncratic, Webster's Dictionary isn't
as truthful as I thought. ;)

Im also very intrested in such an animal. Im a Paragliding pilot and Ham
(SM7LOQ) as well. During flight would i like to communicate to the ATC
center and also having some QSO. A local Ham dealer suggested the new HT
from Standard C508A. You find it on
http://www.stdradio.com/hanheld.html#508
Its "easy" to modify to go in to tx below 2M band but still in FM. BUT
if you place the Tx fq about 10kHz "wrong" will an AM recv "accept" it.
Itï¿½s proven here in Sweden with successfull QSO with the ATC but
the W output is very low.
I have not tested it my self! The information is from the local Standard
dealer.

For years I looked for a radio with these capabilities, with the idea of using the same radio as a 2 meter and glider crew vehicle aircraft band transeiver. Actually the IC-706 does this (after a small mod) but the output on the aircraft band is too small for practical use. As far as I know, no one has yet figured out a reasonable way to make the PA run outside the 2 meter band.

Enno, please read my other post and tell me which of the characteristics that bind socialism to fascism you disagree with. Socialism requires fascism (or at least the threat of fascism) in order to enforce its demands on the individual.

>Remember you live in a FREE country unfortunately with a
>president that can act as dictator..... I think Germany and
>Dutch governments are much more democratic than the US will
>ever have.

This statement is symptomatic of the Big Lie of government. Democracy has absolutely nothing to do with freedom or morality. A democracy in which the majority consists of bigots intent on destroying the minority could be just as terroristic and repressive as any dictator.

>What is a country that prevents CB users to speak with other
>countries?

Your question outlines why, contrary to assertions elsewhere in this thread, an understanding of these concepts is just as relevant to Amateur Radio as to any other aspect of life.

>> "scanner" type scanning.

>Yes. You get 100 memories that can hold any frequency. Unfortunately,
>it doesn't separate them into banks so you have to scan all or nothing.

Unless, of course, you set a specific memory for "SKIP".

>> 6) Anyone know if there is a soft case for the larger batteries? I'd
>> shine NiCads and use the AA case, but I want a full 5w of output power.
>>

>The only "case" I've seen is a rubber thing that goes around the radio which
>makes it easier to hold and protects it when it hits the ground. The AA case,
>even though thick, doesn't support the full 5 watts output (according to the
>manual). This is probably due to the available voltage.

Yaesu also make a soft leather/plastic case for each battery type
(thick/AA and thin). I didn't get it, I got the rubber (orange) thing
to protect it, but the leather case has plastic (clear) for protecting
the keys.

>> 8) Are the 112 memory channels "true" memory channels, or does this include
>> things like call channels, scratchpad, search limits, etc?

>You're right. You get strictly 100 channels for regular memory slots.

The other 12 is for search limits, FYI.

>> Also, anything specifically you don't like about this radio?

>Some people don't like the dim-ness of the lit display. I haven't found it
>to be a problem since it it's really dark, you'll have no problem seeing it.

I believe the lighting is fine.

My only complaint is that you can't use it while recharging with the
NC-60(B/C) that comes with it. Well, in essence you can, but don't plan
on actually charging the battery.

It is a surprisingly well built unit (considering where it comes from,
very surprisingly well built). It is *not* a "sniffer". It wants a good
signal level before giving you a reading. But for most uses that's a
plus not a minus. I like it as a very handy utility counter.

>If you like bells and whistles, buy the Icom.

I have to agree that the DX-70 is probably the best choice. I have been using a TS-50 (mobile) for some time now. Its great advantage is the superb tx audio quality - worth a lot when you are perhaps not as strong as other signals on the band. I have been very fortunate during the last week in being given the opportunity to try an IC-706. There is no doubt that the tx audio is very thin (particularly with its own hand-mic), and reports suffer as a consequence. Although the rx is better than the TS-50's, it still has some major shortcomings. Although I've not been able to try a DX-70 for myself, I've heard excellent reports of its performance (particularly the rx), and those I've heard and/or worked have had really good tx audio. I think the build quality is better on the Icom than the Alinco, but I guess you can't have everything!

The FT-900 is probably the best of the lot (particularly if you want an in-built matching unit), but then it is much bigger.

Hope that helps .. 73

Just tell them you're interested, and don't attach any
transparent sentiment about respect. If you were friends and
the family likes you, they'll know that. Also, you need to do
something so that if you get the equipment at a bargain, it
isn't because you've deceived them as to its value, or because
they were uninformed. Any bargain you get has to be with their
full knowledge of that fact, otherwise you will have used your
friendship to cheat the family.

4014. Re: HTX 202 Error message???

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-13 00:00:00 UTC
From: clint.bradford@atdbbs.com
Message-ID: <960613134755398@atdbbs.com>
Source record: 199648

> message <ER-2>.

HTX-202 Error Codes (taken from a Radio Shack memo)

ER1 indicates an internal RAM error. It appears when the memory backup battery is dead, when something has caused the memory contents to become corrupt, or as a result of physical or static electric shock. To clear this error, turn off the unit. Then turn it back on while holding down the "function" and "D" buttons. This clears the memory. If the error returns after you clear the memory, service is required.

ER2 indicates a PLL unlock. The radio gives this error if the PLL alignment is off or if the transmitted signal interferes with the internal PLL frequency. This error has been reported most frequently when using the supplied "rubber ducky" antenna with either a high-power battery pack or with an external DC source.

According to the memo, the fix for this is to use an external antenna when using external DC power. The memo goes on to say that if the problem persists, send the transciever to the repair center.

4015. Mic for use in motorcycle helmet

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-13 00:00:00 UTC
From: tgoins@accessone.com
Message-ID: <tgoins.2.1112FB09@accessone.com>
Source record: 199649

I'm looking for a good noise cancelling microphone to use inside of a motorcycle helmet with an HT. It must be fairly slim line and small to be of any use. The biggest problem is the pick-up of wind noise as it's howling through the helmet, the noise cancelling operation is a must. Also any recommendations on an effective VOX system to use with the mic and an HT would be great.

I can buy a Collett Communicator (900 MHz) that is made to work on a motorcycle but they are fairly expensive ($225 each) and since I already have several HTs I thought that maybe I could make them work. Any ideas?

Ah! You asked the RIGHT question... which rig offers the most USABLE features. My vote would be for the Alinco DX-70, which I own. It has all the things you NEED for casual HF operating in the car, and not so many silly bells 'n whistles. The Icom 706 is nice, but approximately $400 more expensive, and much more complex. Same for the Yaesu (has a lot more features, and it's also fairly large). The Kenwood TS-50S is okay, but the DX-70 has a better receiver and a detachable front panel in case you want to separate the panel from the main chassis (cables are optional but not very expensive). I'm sure I'll get flamed for saying this stuff, but I've used the DX-70 and TS-50, and have friends who've compared all of them, and the Alinco is definitely the best buy. If you like bells and whistles, buy the Icom.

What about the web site:

http://www.ualr.edu/doc/hamualr/hamualr.html

?
Included in this site is a callsign lookup. The callsign lookup data
base has up to the minute data from the FCC about (I know, only US) call
signs. We have been using this to figure out exactly when we can use
our upgraded/renewed licenses, and it has a pretty good search engine
to find names as well as call signs (and zip codes, etc.).

> bulb near the edge of the tuner case

> Grounding the tuner case to it's chassis (the tuner needed more screws
> added) reduced case radiation by almost 45 dB and cured the RFI!

Tom,

I have had an XMatch tuner for a few weeks now. It seems to perform
as claimed on 160, 80 and 40. But for my 20 meter beam, odd
things happen. Near the high end of 20, my beam has a vswr of around
2.4:1 at a freq I use to chat with friends on the mainland.
Using the XMatch, I cannot get a vswr below about 1.7:1, but
even more strange, when bouncing between XM1 and XM2 switch
tuning positions, regardless of position, I get a sudden, snap,
increse in vswr up to around 5:1 at one particular position of
the inductor tuner. But, there is perfectly smooth tuning
operation through this position on the three lower frequency
bands. Until I had discovered this, I was about to open the
case and clean the coil windings and inductor roller "wheel"
with alcohol. Now believe the inductor is probably ok.

I also am considering taking off the plastic washers and scraping
away the paint from where the top cover and chassis meet;(believe
I mentioned this idea in a note to Paul Schrader). Or,
maybe I should just remove the top altogether?

Also, have you been able to trace the circuit of this tuner;
to me, and I may not have followed the wiring accurately as
the switch positions are changed, it appears that all that is
happening when switching between XM1 and XM2, is that the places
of the tuned and fixed capacitors are interchanged in the "T"
circuit. The variable at the input to the tuner in the XM1 position,
and the fixed bank of 5kV's totatling 575 mmf, at the output.
The roller inductor appears open at one end,and to ground at
the other, with the roller tap selecting the amount of inductance
to ground appearing between the two capacitors, one at the input,

the other at the output of the tuner.

I suppose what is patented is the idea of switching the positions of the fixed and variable capacitors. I don't know what the value of the two section variable C is; the two sections of the variable C seem to be in parallel.

All in all, I don't see anything else unique about Paul's design, except that it really does work on 160, and does seem to be robust! Not sure what is so extra efficient about it, except that it lacks metering, multiple antenna switching, and balun for balanced output, all of which would lower overall transfer efficiency when used, I suppose.

Do you have any other thoughts on the XM Match, Tom? And should I modify Paul's top cover mounting as you say you have done. So far I have noticed no RFI problems. Is the XM you modified used on 160, on 80, and if so, the mods have not messed up the really low band operation?

That's incredible, Tom! I guess they had the cover there for decoration only...<g>

I'm glad to hear about the new MFJ air core inductor. I don't think much of the one they have been using.

I wondered if it was just me, or if they were indeed putting some of those tuners in too small a box. Maybe they are trying to match the size of some of the current solid state HF gear or something. Since I use Collins and Drake vintage gear (in nice, big cabinets!), I guess it just wouldn't occur to me to put the stuff in a (relatively) tiny box when a bigger one is better functionally.

Kinda like my old 500 series Tektronix scopes. One thing I like about them is that the doggone controls are big enough to comfortably use! <g>

Hi!

I recently purchased a commercial Fijitsu Ten FTM40-3092H mobile and got the Service Manual and Pro-U Programming Chip. Noe, how do you (if you can) get this thing programmed into the amateur band (443.00 Mhz)????? I was able to easily tune it to 450.00 Mhz, and Fijitsu Ten service department was able to help me purchase the service manual and programming chip, but they don't know anything else. I would really appreciate it if anyone knows if I can program this rig into the amateur band.

In <4pn8hi$9bb@vixen.cso.uiuc.edu>, wes@prairienet.org (Josh Beck) writes:
> I.E. A sine wave is converted to a radio wave how?
> What is the difference between A.M. and F.M. Short wave?

If I understand your question right, the answer is that an antenna converts a sine wave (at "Radio Frequency") into a radio wave. Your transmitter modulates the Radio Frequency carrier wave with information such as your voice signal in such a way that the antenna emits a narrow band of signals which consist of the RF carrier and associated "sidebands" which actually carry the transmitted voice signal.

Short Wave refers generally to the aproximate frequency range of 2 - 30 MegaHertz (Cycles per Second). Long wave is lower frequencies... as a lower frequency will have a longer wavelength (since wave speed is the speed of light, a constant). However, the term Shortwave is somewhat old; now most general discussions use the xHF designations (VLF, LF, MF, HF, VHF, UHF, etc).

AM and FM are modulation techniques. Simply, AM means Amplitude Modulation, where the RF carrier AMPLITUDE is modulated by the signal to be transmitted, while FM refers to Frequency Modulation, where the FREQUENCY of the RF carrier is modulated by the transmitted signal. There are variants of these, and the theory gets sometimes complicated, but suffice it to say that each has its advantages and disadvantages and that over time the method used in each frequency band and service use has settled down to those methods that for a multitude of reasons work out best.

..Good luck... Get a hold of the "Radio Amateur's Handbook," it was one of my first books on ham radio and it has good explanations of most stuff.

..Peter

>That's theft. Compliance is achieved through the threat of force.
>That's extortion.

[NOTE: Most of my response is simply designed to keep the discussion interesting and, ultimately, relate it back to amateur radio. While I agree with all of the below in regard to individual cases, my personal economic opinions vary pragmatically according to circumstances. I am a proud member of the Democratic party who leans toward social-democracy, but on individual issues, I can also be quite conservative.]

No. Socialism's primary mandate is the nationalization of the means of production. ALL states that produce currency participate in economic control and regulation.

Socialists accept a labor theory of value. This states that the only value in any commodity is based on the labor that went into it. Take, for example, a metal chair. When the metal it was made from was in the ground it was worthless. You might argue that even then it had value. However, the value of the land as a mine is based both on the anticipation that labor will commence there as well as the labor that went into discovering the metal in the first place. The raw material proceeds to finished product by virtue of labor. This labor, and nothing else, transforms something that is valueless into something valuable. In exchange for this the workers receive a wage. Since ALL of the value that went into the object is the product of labor, the wage should equal the total of that labor. Does it? No. Why not? Because this equation has failed to factor in profit. The business owners (let's posit a large number of stock holders for the sake of argument) do absolutely nothing for society. They have not had a hand in transforming the valueless into the valuable, yet they are still getting paid. How? Because, via profit, they are STEALING value from the workers. Thus PROFIT equals theft, not taxation.

You might argue that the business owners have taken "risk." The Socialist answers that this is utter nonsense. Their risk is essentially nil--only paper, or worse, clicks in an account register. The workers on the other hand risk their lives, the time and value.

People with your mindset have fallen for the great con--the real thieves have deceived you into believing that the so-called government (which is really the collective will of the people) is the enemy when, in fact, it is the business owners. Unless of course you ARE a business owner, in which case you are a thief yourself.

Now, getting away from economics per se, what about "regulation?" Let's use amateur radio as an example. There are no doubt individuals who would like to end all frequency regulation whatsoever. However, this would OBVIOUSLY make the bands unusable. Thus, all of the good things we do in Ham radio, ARES, MARS, RACES, SAREX, Handi-Hams, would be wiped out. To paraphrase Hobbs, in such an environment, our "amateur radio experience" would be nasty, brutish and short. However, we as a people, through our representatives have determined that if we regulate the bands they will be more useful and more enjoyable than if they were left unregulated. Most hams WANT regulation of the ham bands because clearly such regulation is in the best interest of EVERYONE.

Is it really such a stretch to imagine that there might be other areas of life in which such regulation might be desirable? Today I got a notice from my city that I had to trim my tree. The city has an ordinance that states that no tree may have branches hanging lower than ten feet into the street. I was annoyed when I first opened the letter. I don't really have time to go out an trim my tree this weekend. However, on second thought, I imagined one of my neighbors running into the tree and changed my mind. I appreciate the reminder. You might say, "well, your neighbors should look out for the tree," or ""If your neighbors don't like your tree they should move to another neighborhood." Perhaps. But if we extend this logic to every facet of life, your proposal would lead us back to a state of nature something rather similar to that of the Neanderthal in which the physically strong had the RIGHT to oppress the weak. This is the irony of the so-called "freemen." The broad application of their definition of "freedom" would make us all slaves.

FWIW, the Radio Shaft DSP (just bought mine for $35 and cuouldn't resist cracking it open) is based on a Texas Instruments core. For those of you who are curious and/or care, the part number is TCR1007, which sounds like a custom mask just for RS.

It works pretty well on 2 & 6 sideband, but the audio is wimpy with the rig I'm using (Yaesu FT-221).

I just received this message from a friend. It's very interesting
to say the least.

* * * * * * * * * * * * * * * *

KENWOOD ANNOUNCES NEW DISTRIBUTION CHANNELS

Longing for a new Kenwood TS-870S or maybe a TM-733? Soon, you might find them in your local CB shop or truck stop. Citing concerns about the future of Amateur Radio and a changing business climate, Kenwood Communications Corp announced to its dealers on May 21 it's taking "some bold steps" to turn things around. Kenwood has appointed three new companies (as yet unnamed) to wholesale Kenwood Amateur Radio products "to CB radio stores, truck stops, 2-way radio stores, and electronic re-sellers," according to a letter to its dealer network.

Kenwood says it believes its new distribution strategy will benefit the hobby by increasing the visibility of its Amateur Radio line through small dealers to help draw newcomers into the hobby.

The company also says it plans to offer a new pamphlet or "primer" about Amateur Radio to introduce people to the hobby. The primer will be free. In addition, Kenwood will start selling Amateur Radio study guides and has urged its authorized dealer network to help distribute the new materials. In conjunction with its Kenwood Report--distributed to ham radio clubs--the company also plans to offer "incentives for local clubs to gain new members using the Kenwood Amateur Radio primer and licensing materials." In a May 28 letter to authorized dealers, Kenwood described the moves as "our first stage of activities to promote Amateur Radio."

Kenwood says the extra step in the new distribution chain will guarantee that existing authorized dealers always have a price advantage over the smaller resellers. The company also denied rumors that it plans to exit the Amateur Radio market.

Works for ignition noise OK. But if the signal is strong (especially in the AM mode), it will make things worse.

Looks like you have to do the boy scout "solve the problem at the source" thing that the self-rightious and the ARRL are always preachin'.

You could always stick to working only the strong signals. In the mobile, the weak signals probably can't hear you anyway.

I have this happen several times but turning the HT off then on again has
always reset it. I think it is caused by using external power on high power
with an inadequate antenna (the rubber duck)

Source record: 199431

I'm looking for information, and a possible source of manuals/diagrams of a Pearce-Simpson model Newport-D receiver. This is a transistor, 12-volt DC unit made in Japan around 1968 or so. It has a top-mounted, manual/motor-driven rotating ferrite bar antenna, and side-band with BFO capability. Frequency coverage is "beacons," LW, 150-400KHz; "Broadcast," MW, 535-1605KHz; and "Marine," MW, 1600-3990 KHz. It is in a metal case about 11-11-6 inches, including the ferrite bar. The unit also has a long telescopic whip antenna.
I'm looking to sell it, but want some idea about what it went for new, and whether it might have any slight collectible value. The unit is in excellent condition, and works very well on all three bands. I don't think it ever spent any time on a boat other than the one that brought it here from Japan.
If you're interested in acquiring it, or could just help out with any info, please E-mail me at
brent.reynolds@swsbbs.com or call any time, Atlanta, Georgia, 404-814-0768.
Thanks.

I have been using a DX70 in my mobile for the last 6 months. It has been a very good radio; it replaced my TS140 which I had for ~3 years. I have friends that have the Icom 706 and it too is a good radio, but much more expensive (~$400) and it is more difficult to use in a mobile environment. My only complaint wiwth the DX70 is the short separation cable if you want to separate the control head. The cable is only 5 feet long, too short to place the radio behind the seat in my pickup. I used two cables to get the extra length, however, Alinco does not recommend it due to the possibility of noise pickup etc.

Hi Tom here... I am in need of a manual or sevice manual on
a Lampkin Labs 107C. To correct the Dev meter side. A schematic
or photocopy of any of the above would help....
Tnx De Tom.

Posting for a friend who no longer has access (he retired!). Please
respond to address below. Thanks! Mike, K0TER

Could someone please e-mail me with addresses or phone numbers
of a place that I might get software to control an ICOM 706 and ICOM T7A.
Preferably for DOS but I'll take a windows version.

This is supossed to be available but I can't find it.

Thanks, John N0KIC. Please e-mail to > jwc@juno.com <

Those connections were used by the IC-7072 adaptor. The IC-7072 attached the
720A and The IC-R70 receiver so the two units would transceive.

I looked at the FT50 at Dayton thisa year. The ads made it look pretty good, but I found out it won't do simul VHF/UHF receive. Same with the Icom T7A. I got used to that with my old Yaesu FT470. I bought an Icom IC-W31A. It does simul VHF/UHF , VHF/VHF , UHF/UHF receive. I receives all over the place - 100-180 VHF 300-800 UHF and is modifyable for 800-999 receive. So far I'm satisfied with it. It was just over your $ limit ($380 with tax at Dayton). By the way, I liked the Yaesu FT51, but it doesn't look like it can be modified for 800-900 receive (I like to listen to the local PDs on 800).

Skip
K9SA

btw, the Alinco DJ580 has been out of production for a couple years.

4059. Odd TVI Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-14 00:00:00 UTC
From: Keith Poole <kp2a+@andrew.cmu.edu>
Message-ID: <klkLoJO00iWUI2pqQs@andrew.cmu.edu>
Source record: 199449

I am having an odd TVI problem. I have an ICOM IC765 running about 70 watts on the 3rd floor of my house with no practical outside ground (no choice about where to put the equipment). However, I do run a coax down to several ground rods 3 floors below. I have a TV set hooked up to a cable TV 6 feet away from my equipment and I can see no interference on that TV. However, down on the 2nd floor of the house, when I'm on 10 meter CW I tear up the TV set down there! When I'm on 17 meter CW, I tear up the VCR on the 2nd floor when its recording but NOT the TVs! I presume that the RF is somehow getting into the cable line??? But why isn't it interfering with the TV set that is also hooked to the cable but only 6 feet away from the transmitter?

I would appreciate any recommendations & advice. Can I purchase some simple filters for the TVs & VCR that will stop the RF from getting into them? My wife is very unhappy.

Thanks.

That's funny! I read his request over and over again
and I fail to see where he said that he planned to transmit
on frequencies where type acceptance is required! Maybe using
a modified radio as an extra receiver does not make it "a handy test
instrument". I guess the English language is not precise enough to need
the word "transmit" before we assume what he means!

Hello David,

Very nice to hear from you again. The filters mentioned in the article sell for about $93 each in small quantities but drops considerably in quantities of 10 or more (I inquired just recently). I know that is a lot of $US in Scotland. I do recall that you asked once before if I could help out in that regard. Unfortunately, I would not be able to be of much help because of the legalities involved.

They are very nice filters, though, and I did a lot of work with them during the preparation of the RF Design/QEX article. Yaesu is now using them in a new Ham Xcvr.

If you and your friends wanted to do a group buy you could contact:

Hey Ken what are the "WAY too many problems...." ?

I have 2 of them and they both work outstandingly both as a HT and a
neat scanner.

The big complaint I see is those folks who spent the money to use it as
a broadcast band monitor. Big deal the wrong filter is in it.

To each his own. Later

>>That's extortion.

>No. Socialism's primary mandate is the nationalization of the
>means of production.

Focusing on "means of production" is the method by which the
socialist prevents politically ignorant followers from
detecting his true motives. In fact, his platform is one
that promotes the control and enslavement of all citizens,
producers and consumers alike.

In contradiction to this trickery, Webster's clearly states
that socialism is "a theory of social organization based on
government ownership, management, and control of the means of
production AND the distribution AND exchange of goods. This
definition not only covers every aspect of the economy, but
also of the very means by which individuals sustain life.

>ALL states that produce currency participate in economic
>control and regulation.

Economic control through manipulation of the money supply
and other means is merely one tool by which socialism
empowers itself at the expense of the individual. As a case
in point, by printing currency for its own unproductive use,
and by refusing to pay its debts in a manner consistent with
economic morality, the socialist government exacts payment
for its sins through devaluation of existing currency. In so
doing, it steals from evey citizen, including the precious
"worker" which it otherwise claims to exhalt above all else.

>Socialists accept a labor theory of value. This states that
>the only value in any commodity is based on the labor that
>went into it.

Such theories are demonstrably false and serve only to bring
the socialist to power. Their promotion creates resentment
and greed within the population, uniting the masses against
an invisible and nonexistent enemy.

That said, in your example of the production of the chair, no amount of labor will render it of value if it only has two legs. It should be evident to any rational person that labor alone is not the determinant of its value.

>In exchange for this the workers receive a wage. Since
>ALL of the value that went into the object is the product
>of labor, the wage should equal the total of that labor.

No, the value of the chair is determined solely by its perceived desirability to those able to buy it. In a free society (which is NOT the goal of socialism), the buyer is allowed to determine its worth through his decision to purchase it. Government intervention in this process, through regulation of the availability and price of all chairs, denies the purchaser the right to determine the value of such products for himself. Considering that the purchaser is also a worker, governemnt has thereby forced all workers to buy necessities of life which may have a value far less than what could otherwise be justified, and has rendered those workers captive to a single source. In this way, socialism supports those in power through theft of the workers' earnings.

> Does it? No. Why not?

The Big Lie of socialism is coming up.

>Because this equation has failed to factor in profit. The
>business owners (let's posit a large number of stock holders
>for the sake of argument) do absolutely nothing for society.
>They have not had a hand in transforming the valueless
>into the valuable, yet they are still getting paid. How?
>Because, via profit, they are STEALING value from the workers.

The business owner(s) are entitled to whatever profit results from the sale of the chair by virtue of the fact that they have paid everyone concerned for the right to own it. Because they own it, they are morally entitled to sell it, scrap it, or use it themselves. They are obligated to no one.

By pitting workers against business owners (who are workers themselves), socialism grants itself absolute control over all citizens. It denies the right of the business owners to do as they wish with the products they have paid to produce, and in so doing, it denies the right of all citizens to the sovereign ownership of property.

>Thus PROFIT equals theft, not taxation.

This is ludicrous. The laborers' hours and wages are the result of entering into a VOLUNTARY agreement with the owners. Taxes demand payment from workers under THREAT OF FORCE.

>People with your mindset have fallen for the great con--the
>real thieves have deceived you into believing that the so-called
>government (which is really the collective will of the people)
>is the enemy when, in fact, it is the business owners.

What exactly is the collective will, Arden? Is it the will of 50% of the people? More? Less? Who compiles the individual opinions necessary to determine collective will? Which topics is the collective will based on? Economics? Politics? Favorite color toilet paper? Who determines the topics to be considered and their relative importance?

The summary answer to all the above may be stated in one sentence: COLLECTIVE WILL is constituted solely by opinions that are formed of, by and for the government. It is falsely claimed to represent the wishes of people who not only don't agree, but who are incapable of being homogeneously defined. It further assumes that those in government, in their infinite wisdom, know what is best for their subjects and are incapable of being seduced by the availability of unearned (and nearly unlimited) money and power. The irony to this is that creation of unearned money and power is the sole basis by which socialism survives.

In any event, there is NO such thing as COLLECTIVE WILL. It is merely a tool used to empower government at the expense of the freedoms of its citizens, and it has been used by every tyranny on the planet to subdue individual citizens for purposes of extorting their labor, property and earnings. COLLECTIVE WILL is, in fact, the will of the GOVERNMENT, not the will of the individuals which such governments claim to represent. There are NO exceptions to this in the entire history of man.

>Unless of course you ARE a business owner, in which case you
>are a thief yourself.

You certainly haven't proved it, nor will you.

Before leaving this topic, I want to mention one other thing to U.S. readers. Arden's post presents socialist views that are overtly recognizable as such to many people. However, socialism is an instrument of government that can manifest itself in many forms. Arden's view of a world in which a classless society is governed by an omnipotent government is much nearer, and considerably more likely to evolve in full, than the free society desired by our forefathers. It is the product of those who seek power over others, and our continued refusal to recognize it for what it is will lead to its certain implementation.

I will reply to the section of this post relating to spectrum and Amateur Radio in a second article.

73,
Jack WB3U

to
>several ground rods 3 floors below.

I wonder why you use coax? I'd use wide smooth flasing for a lead, it has
less resistance and lower impedance.

In any event, it'll be hard to get a good RF ground up on the third floor
with using a large counterpoise near the rig.

>I have a TV set hooked up to a cable
>TV 6 feet away from my equipment and I can see no interference on that
TV.

>2nd floor when its recording but NOT the TVs! I presume that the RF is
>somehow getting into the cable line??? But why isn't it interfering with
>the TV set that is also hooked to the cable but only 6 feet away from
>the transmitter?

Different equipment and different locations, I would guess. The single
most effective thing I have ever done to elimate TVI is grounding the
cable TV shield to the power line safety ground (that's the bare wire
connected to the metal box) at the outlet serving the equipment, and bring
all the cables (power and antenna) up to the TV-VCR in one bundle. That
stops RF ground loops through the TV-VCR.

Source record: 199498

Todd,

You might try the Nady headsets that come with their wired intercom. The whole intercom (rider to passenger) runs about $70-80, cheaper from JC Whitney. One of the cycle magazines, I think it's Cycle World regularly has an ad for the systems.

You can buy just the headsets for about $24 each plus shipping. I've used one for my HT, and it seems to work alright. I've had good reports on the audio, and it doesn't seem to pick up wind noise. I made a simple adapter for the mini-stereo plug to fit my FT-530. I haven't been using it lately because wind noise is to loud for me to hear incoming audio (time to buy a new helmet.)

The design is a thin speaker enclosure with microphone on a flexible goose-neck. Cable and plug is similar to light-weight stereo headphones. You can velcro it into your helmet, or just stick it in each time you pull the helmet on (my method.)

Good luck. If you want more info, I can look up the ad and give you a name, address, phone number. Let me know.

Jerry

>Tommy SM7PAF

The FT-50R has a single receiver/transmitter, with multiple VCOs.
Therefore, it can *NOT* act as a cross-band repeater. That's what was
sacrificed to make it so small, and relatively inexpensive.

Other than that (and the "wide" FM problem) I'm rather pleased with it.
Now, I just have to take the test and get my ticket. It's tomorrow
(june 15). Wish me luck! (I'm going for tech+, possibly general, if I
can hack the 13 wpm)

Source record: 199515

I have both a Kenwood TM-732 and TM-733 and have a slight problem with the 732. I have put it into demo mode and don't know how to reset it. My 733 has this feature mentioned in the manual and how to enable/disable it but the button-strokes must be different because it won't work with my 732.

What the demo mode for those that don't know is: It cycles through all the indicators, all the LED's flash the backround light goes through dim to bright and the signal strength meter runs from S1-S9 and back continuously. It also display HELLO and Enjoy Hobby on the display.

The radio still works but this is a real nusciance. If anyone knows how to turn this off without doing a total system reset, let me know please. If you could email me direct I would appreciate it.

>whatsoever. However, this would OBVIOUSLY make the bands unusable.

Hold on there, Arden, its not obvious to me. Owning land
without government regulation doesn't make it unusable, nor
does owning a business, a house, a computer, or anything else.
Why couldn't I own, say, 70 MHz to 71 MHz? What would make
it unusable, and why is it reasonable to expect it to be
usable when the government grants it through a license, but
not when I own it outright?

>Thus, all of the good things we do in Ham radio, ARES, MARS,
>RACES, SAREX, Handi-Hams, would be wiped out. To paraphrase
>Hobbs, in such an environment, our "amateur radio experience"
>would be nasty, brutish and short.

Maybe, maybe not. Maybe we would all say the heck with
ham radio, sell our homestead frequencies and retire
to St. Bart.

>However, we as a people, through our representatives have
>determined that if we regulate the bands they will be more
>useful and more enjoyable than if they were left unregulated.

When did we do that? In the U.S., the great majority of
people had no voice whatsoever in determining the use to
which the spectrum was put. In fact, most of the U.S.
population wasn't even aware of the need to make such a
decision, and no representatives were elected on the basis
that they were qualified to do so.

Also, in the U.S., the final result was a mixture of the
desire by the U.S. military to confiscate all frequencies
for its own use, and Congress, who finally (by a narrow vote)
decided the military shouldn't be allowed to accrue that much
power in comparison to itself. Congress won this power
struggle only because of the Constitution of the U.S.

>Most hams WANT regulation of the ham bands because clearly
>such regulation is in the best interest of EVERYONE.

Bullcrap. Most hams want regulation because it provides
them with free spectrum.

>Is it really such a stretch to imagine that there might be
>other areas of life in which such regulation might be desirable?
>Today I got a notice from my city that I had to trim my tree.

> > Best regards.
>
> Perhaps a direct discrimintor audio output (before deemphesis) to drive
> a sub-audible decoder or 9600 baud packet?

The discriminator circuitry is found in the receiver of your
radio. It follows the last IF stage which is usually 455 Khz. The
discriminator circuit separates the audio content from the RF signal and
passes it on to the audio stages in your receiver. In most radios today,
the discriminator is found in an IC which contains the last IF stage and
the discriminator. The output of this IC is the audio content. A common
IF chip of this nature is a Motorola 3359.

Hope this is helpful.

Has anyone else found the game function of the FT-50r? I can't figure out how to play, keep getting a zero score...

I wonder what else is hidden in the innards (small as they are) of this thing?!?!

Cheers

Anyone have any experience with the Optoelectronics' 2600HA frequency counter? Does it rate as a "sniffer"?? How does it compare the "cub"? I have to be right on top of the signal source to get a reading most of the time!
David. N4ZGT.

What are peoples' opinions on Radio Shack's HTX 212 2-meter mobile?
Apparently, price has been reduced to $269.

>What is wrong with some economic control and regulation?
>I don't see anything about stealing there.....

Hi Enno,

The answer to your question is not simple, but it can probably
be answered reasonably well by the following:

[What is wrong with some economic control and regulation?]

First, economic control as I believe you mean it is legislated
in the name of "the public interest." Variations include the
"national interest," "public good," "society" etc.

The problem with this is that there is no such entity as
"the public." "The public" is actually only a number of
individuals. Therefore, any law that purports to place the
"public good" above the interests (rights) of private
individuals can do so in only one way - by giving the
rights of some individuals precedence over those of others.
In so doing, the government grants itself the power to deny
the rights of individuals of its choosing, in effect
reducing the rights of all to merely privelages.

If you're still not certain why this is wrong, let me know
and I will attempt to explain a few of the concepts that
differentiate moral from amoral society.

[I don't see anything about stealing there.....]

Irrespective of government-recognized paperwork such as
deeds and titles, ownership is evidenced in part by one's
ability and right to control the possession and use to
which property is put, said property having come into the
owner's possession by moral means. As such, no other
entity can exert control over the property without denying
the rights of the legitimate owner, and without ascribing

the rights of ownership to itself.

Because of this, it is not possible for government to dictate any aspect of the possession or use of earnings or property (assuming such use does not infringe upon the rights of others) without seizing the right of ownership. Further, as most citizens will naturally resist such attacks on property they own, compliance is usually achieved not by purchase or other moral means, but by threat of force.

So, in direct response to your statement, the government must deny the rights of private individuals in order to control their property. Unless such control is exercised to enforce payment of legitimate debt, it is theft. This principle applies to all forms of economic control.

>If you mean confiscating property I think you are a bit
>confused with communism or some lowlife dictatorship.

Labeling various philosophies as fascist, Marxist, communist, etc. is merely a means of describing the extent to which socialism is employed, and the exact methods by which it is enforced. All these governments share certain brutal similarities regarding confiscation of property and earnings. The underlying philosophy in every case is socialism, and the U.S. has succumbed to it as well.

As a side note, socialism may also be rightly called a form of collectivism, statism or authoritarianism. All are substantially contradictory to the efforts of our founding fathers, and it is important to realize that the U.S. was the FIRST nation in history to ever put them aside in favor of a moral society based on individual rights.

Unfortunately, the U.S. has since managed to screw this up. We are now much like the rest of the world, which has never fully grasped these concepts, let alone put them into action.

Anyway, if you are interested, I will be glad to post an example or two of socialist-sponsored confiscation and extortion in America.

73,
Jack WB3U

>The biggest problem is the pick-up of wind noise as it's howling
>through the helmet,

since I already have
>several HTs I thought that maybe I could make them work. Any ideas?

Todd:

Why not try a throat microphone. It works directly off the
vibration of the throat and does not rely on the air pressure around it to
work.

Don't try a microphone/ear piece in one unit. There is
susceptibility in those units to wind noise picked up when one opens their
mouth to speak.

Message-ID: <960615083017530@atdbbs.com>
Source record: 199545

How to add a hold function to the Radio Shack RF Frequency Counter:

Ground TP17. In the schematic, TP17 is pin one of U3, connected to
+5V thru a 47k resistor. On the circuit board, TP17 is on the display
side, just right of the lower-right corner of the IC. Grounds are about
1/4 inch below and to the right, the three non-tinned points in the large
area of metal.

I grounded TP17 directly and the display stopped. After lifting the ground,
the counter resumed counting at the beginning of a sampling cycle.

Personally, I would ground TP17 thru a 1k resistor. I haven't performed
the mod to my RS counter, since the pads are VERY small and my fine-tip
iron is at work. I will try the 1k Hold mod on Monday and give a report
(unless somebody beats me to it).

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I used the old element from a Yaesu headset for an FT-207R. (With a Bell
full face helmet, and the mic embedded in the chin bar.)

I have tried VOX operation but found two main problems. The first is
that wind noise rises dramatically at speed, leading to your mic
tripping on the rig just from normal highway speed, for example. The
second is more personal, and has to do with whether or not you want all
your "comments" on fellow motorists broadcast.....

They've got a new model out, the HTX242, so I imagine the 212s are on close out. I have one, it works OK except for one thing: in strong signal areas the squelch continually pops open and makes noise. I hesitate to call this intermod since you never actually hear anything but noise, but it is obviously strong signals outside the 2 meter band, as the lcd meter is as far as it will go. Unlike the HT, the 212 has expanded RX coverage. If you live in a more rural area, this might not be a problem. Or, you night use a strip line or bandpass between the rig and antenna. Otherwise, look for something else.

4114. New Mods for FT-50R, extends T-band TX, 220 TX and Cell-band RX

If you are interested primarily in FM, then a j-pole ought to be fine. If you are interested in SSB, then most of the stations will be horizontally polarized and a horizontal antenna will be more helpful, especially with the locals. Even on Sporadic E, a properly acting vertical antenna can take a bit of a beating because the signals can come in at such high angles--this is why sometimes a beam doesn't show much directivity. A vertical usually doesn't do well at high angles of radiation.

I recommend Robert Shrader's "Electronic Communication". It is a good
textbook, and should help get you off ground zero. Alternately,
the Amateur Radio Relay League, in Newington Connecticut, sells
numerous books focused on amateur radio. I don't have a specific
recommendation with their books, although "Introduction to Amateur
Radio" might be a good place to start.

>
>Eventually, although regrettably, I also feel that hams will feel the
>pinch of technology sueeezing them ever higher in search of usable
>spectrum. However, I also feel that existing spectrum resources can
>be more efficiently utilized by projects such as LEO.
>
>-Jay Boyer N4RLL

The LEO band-grab seems very reminiscent of the way General Motors bought out community rail systems in the 40's to make way for a maximum number of GM products. (To say it's "technology" pushing hams is wrong. It's good old "politics" pushing us. Goverment is applying it's powers of imminent domain to current occupants so the "property" can be given to massive companies and/or powerful individuals such as Bill Gates and McCaw Cellular d/b/a Teledesic USA.)

The LEO systems are no different, They are a way to make all individuals pay for access to the radio spectrum on a minute by minute basis. To portray LEOs as an improvement of spectrum usage is doublethink. While we hams haven't been the best example of spectrum efficency, commercial usage has been much worse. (Unless you _really_ think satellite TV programming has no duplication and represents quality usage.)

I suspect the LEOs application to supplant/replace wireline and terrestrial telco systems will be a poor usage of our 2m and 70cm bands. Since the eventual application of this technology is to allow distribution of entertainment programming (the main use of internet accesses and the main claim to fame of LEOs) hams will have been eliminated so mom and dad could use the computer to babysit their little darlings.

Pretty ironic for ham bands to be eliminated by a technology that hams pioneered. Especially for such as useless service.

The real mistake we made was to remain (relatively) silent when 220MHz was taken, or when the spectrum sales started. We should have aggressively pushed the idea that spectrum access was more like water rights rather than private property ovnership. The die has been cast. I predict the loss of one of the two bands this go 'round. The process will eventually continue from our lowest kHz to our highest MHz as we hams can't justify free access to such valuable "property". We're obstructing _someone else's_ earning a living.

One thing I've wondered about: when these companies "buy" a slice of spectrum, how do they write off the purchase on their taxes? Is it by the ACARS method or lump sum? Is it considered "real" property or just an intangible assett? (I don't really believe that all the purchase money goes and _stays_ in the treasury. I bet it's written off and we're not really getting _anything_ in real compensation for our losses.)

I recently ordered a FT736R xceiver, with a R232 interface. Naturally as things go everything arrived in fine shape but the software to control the thing. On contacting YASEU they informed me they don't make a softwarre program to control the interface. Instead they faxed me a list of those who may or may not have a radio control software. After going through the list, even being told by one supplier that the 736R was to dumb to control, I went through the WEB looking for a shareware program, no luck! This is a pretty popular set-up and surely somebody makes a software program for it. Any way I'd appreciate any reference to where such could be found by someone who knows more than I. Cliff KC7PPM

Hi Josh.

I'm sure the family is feeling a great loss in the death of their husband/father. A mistake many people make in this situation is to 'leave them alone so they can grieve'. They would probably find great joy in hearing that his interest in this hobby (which he probably loved very much, as hams go...) was passed on to you. Something like this would be nice:
"Hello, Mrs.XX, I wanted to stop by and tell you that Mr. XX and I shared a common interest in amateur radio. I learned a great deal from him, and was wondering if you would consider selling his equipment to me. Did he ever tell you that he was the one that urged me to take my amateur license exam..."
Then let this follow with a conversation about Mr. XX and his influence and affect on you. I'd bet money that she'd be just beaming after the talk with you.

I think I listen to too many talk-radio psychologist shows...!

The old filters were bigger, had more inserion loss, had more intermod problems and were not as rugged. I can't think of any way that the old filters are better, except that they may be available at flea markets. Even then, we need to be sure that they haven't been damaged in one way or another. The new models are really neat.

Hold the phone, Ethel! Neutral and safety ground are *required* to
be bonded together at the breaker box. This is mandatory under the
National Electrical Code. If you've broken that connection, you've
created a potentially lethal situation.

Clearly, you have a fault in the radio from hot to chassis. When
you bonded the chassis to safety ground, that fault showed itself
as it is supposed to do and blew the fuse. You *must* repair this
fault before proceeding or you could be killed working on the radio.

There seems to still be disagreements among historians and scholars as to the general attitude of the German population during this time. However, your point is well taken.

My first wife was German and I was got married there. Her father and two brothers served in the German Army, Air Force and Marines and were all captured. By mere coincidence, they all arrived home on the same day. Her father worked for the Bundespost (German Post Office). None of the family ever belonged to any of the Nazi organizations (which was difficult as government employees were expected to). None of them shared the Nazi ideals. They did have the required picture of Hitler and a copy of Mein Kampf, but they were only brought out into view if they had a visitor they did not know or trust.

During the war, Jewish prisoners were used for maintenance around their apartment building. It was obvious they were not receiving sufficient food. My ex-parents-in-law would wrap up food and put it the garbage cans for the prisoners. If they had gotten caught it is quite possible they would have been killed. Not ever having gone through something like that, I cannot imagine how much courage it took to perform an act that could easily end up in death.

Anyway, certainly not all Germans were accomplices of the Nazis

And, it still amazes me that folks keep overlooking Josef Stalin who had 20 million people killed, over three times the number in the Holocaust.

4139. Need schematic or help on MFJ-1214 CW/RTTY

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-16 00:00:00 UTC
From: cbenjam@dinfsvs.com
Message-ID: <4q1fm1$guh@tkhut.sojourn.com>
Source record: 199468

I have a MFJ-1214 CW/RTTY/FAX computer interface that works fine except when transmitting RTTY, it keys the transmitter fine but the afsk out will work for a few seconds and then quits, and the transmitter still stays keyed. It had worked fine in the past but now it does this constantly. Any help would be appreciated. You don't have to write me and tell me not to buy this junk, I have learned my lesson!

Yes, I'm currently getting a reasonably clean 100W on 4m from the IC-706, from the mod I have devised, my thanks going to Icom UK for the kind loan of the rig to perform the 'experiments' on! The mod is due to be published in a forthcoming issue of Ham Radio Today magazine.

Hope that helps.

From: afn35036@afn.org
Message-ID: <31c45ec1.5408959@usenet.afn.org>
Source record: 199471

I've been thinking of getting the ADI AR-146 2m mobile from Artcom (Montgomery, AL). I've talked to one local ham who has the ADI mobile and he seem to be happy with it. Has anyone else tried their products, HT or mobile, and have an opinion. The mobile rig at Artcom is $245, including shipping, which is less than AES. Has anyone purchased anything from Artcom have an opinion?

Thank you for your help.

Steve

I bought one in December 1995, used it very infrequently, and generally
on low power, through April. Took it on a road trip and it died after
about 10 minutes of QSO. Really didn't think that was very good at all.

There definately is something going on with the squelch, it constantly
needs to be adjusted and it seems as if it needs to be set pretty much
"all the way up" just to keep S-nothing signals from breaking it.

It does have fairly good recieve sensitivity (when compared to an HTX-202).
I kinda like the rig but its been to the shop twice now since April
(they never fixed it the first time). So... I'm having a hard time
recommending it to you. On the other hand, it's cheaper than most
& there's almost always a radio shack around if something happens to it.

It *seems* to be a pretty good radio but if you do get one you should
seriously consider the TSP the salesperson will DEFINATELY offer you.

Good luck... 73 Andy KC6NMD

> KC5FLJ

With a Skyhook, of course! ;-)

You can hang it just like any other dipole antenna ... if the twinlead you made the dipole from is not very strong, you can string some nylon monofilament line (replacement line from a "weedeater" is good, and available in heavy sizes) alongside it, tying it every five feet or so. If you are going to feed it with coax, be sure to use a 4:1 balun, NOT a 1:1 balun! If you feed it with twinlead down to a tuner, that's fine too! If you have not already constructed it, you might consider making it out of 450 Ohm line with copper-clad steel conductors (for strength) ... stocked at Amateur Electronic Supply and lots of other dealers.

73, and good luck!

>operation through this position on the three lower frequency
>bands. Until I had discovered this, I was about to open the
>case and clean the coil windings and inductor roller "wheel"
>with alcohol. Now believe the inductor is probably ok.

That's caused by a series resonance in the roller. It's a common problem on the higher bands. The only cure is to avoid that tuning combination, or to add a shorting switch that connects the center of the coil to the chassis.

A half fast fix is to position a grounded metal plate near the center of the roller, and bend it in close to the winding to move the unwanted resonance lower in frequency. Be aware this "fix" just moves the problem to some other tuning position.

Series resonance is a huge problem with Oren Elliot rollers like MFJ and others used, and is also a problem with the nearly identical Cardwell roller used in the X-match. MFJ finally abandoned that style roller after years of roller troubles and now uses a cleverly designed air wound roller that shorts the center on the higher bands.

The Q of the new MFJ roller is over twice the Q of the Cardwell roller in the X match. You might consider installing one if you can't cure the unwanted resonance by some other means.

>I also am considering taking off the plastic washers and scraping
>away the paint from where the top cover and chassis meet;(believe
>I mentioned this idea in a note to Paul Schrader). Or,
>maybe I should just remove the top altogether?

I'd ground the case properly. I have no idea why anyone would float a metal case at all four corners. Removing the case, floating the case, or

grounding the case....there is no difference in efficiency. There is a heck of a difference in RFI, however. With the case in place but not grounded at all the corners, losses -if anything- are higher.

>Also, have you been able to trace the circuit of this tuner;

I only looked at the network casually, and would hate to give a definitive description. Nothing I saw made me say.... "why didn't I think of that". It was just a simple three element matching network. If you've seen one three element matching network, you've seen em all. Just swap the components around.

>I suppose what is patented is the idea of switching the positions
>of the fixed and variable capacitors. I don't know what the
>value of the two section variable C is; the two sections of
>the variable C seem to be in parallel.

Almost anything can be patented if one cares to spend the money and time...and write a good story. I'm sure every possible combination of two capacitors and one coil has been used for many years in hundreds of applications.

Until a week ago, all of my ham gear had nameplates that said either Motorola
or Johnson... Commercial gear has its own advantages and disadvantages when
compared to ham-specific gear. Don't knock it until you've compared, say, a
TH-79 with an MT500 on a building with about 50 UHF repeaters on it.

Hmm, KA1VBQ's distaste for amateur radio has been stated many
times by her father. Perhaps she felt no one would talk with her
courtesy of guilt by association with K1OIK.
I have no idea as to why N1XIY refused the equipment, his
license is less than a month old. I am reasonably certain however that
K1OIK had no part in assisting Abram obtain his license. Perhaps he
did not like the assumed motives of the gift-giver.
K1OIK has been trying to sell his gear for a while now but
apparently no one wants to deal with him. That doesn't suprise me
considering the tact and reasonability he has displayed in the venues
where he has attempted to promote a sale.
There are numerous charitable agencies that will accept the
donation of the equipment and provide a tax deduction for K1OIK. An
added plus for K1OIK would be he would not have to deal with any of
the hams that he finds so distasteful.

A friend of mine owns a Alinco DR-130T. He has had it for a couple of years.

In February the power ic smoked. It was sent in for repair by Alinco...and

a few weeks ago the new ic smoked. Has anyone had the same experience with

the power ic. SWR on antenna is fine.

Thank you for your time. Brian KG8CO

4168. FT-50R program kit/where can I get?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-17 00:00:00 UTC
From: estedman@aol.com
Message-ID: <4q4ne2$16c@newsbf02.news.aol.com>

Hi -
where can I get a programming kit for the Yaesu FT-50R that everyone is talking about?
HRO says its not available yet - but people have them.
Is the connector the same as for other Yaesu rigs?
Any help is appreciated.
Thanks
Ernie

Got it in one!

If you want the best hf mobile, go for the DX-70 (or FT-900).
If you want bells (or whistles), then it has to be the IC-706.

I'd like to locate Processor Concepts. I have an Icom repeater that has their software in it and I'd like to change a few things, like call sign. Can anyone tell me how to locate the company or a Scott M. Freeberg from the company? Or can anyone provide me with the original software Icom offered in the RP-3010 repeater.

Thanks in advance,

Dean

HP 8920 communications test set, unit was accurate and stable withing
10 Hertz from 60 to 512 Mhz, not bad for 99 bucks, It had some significat errors
around 900 and up, but not too bad say 1 or 2 Khertz. A good buy if you
do the hold switch mod. Not as stable as a Startek or Opto, nor as sensitive,
but we used it to align 9600 baud biz band data radios when the HP was out for service
to within 700 Hertz at 467.

4172. Hopeless to run HF voice at 100 watts?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-17 00:00:00 UTC
From: charles1@netcom.com
Message-ID: <charles1Dt4En2.3zu@netcom.com>
Source record: 199383
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.misc

I recently got my general, and have trying my luck on HF voice
using a TS820 running 100 watts, antenna tuner, and a 64 foot folded
dipole at 7' in my first floor apartment (also a Carolina Bug Catcher
sitting on mag mount on floor with two 30' folded counter poise wires).

My luck has been rotten, (with exception of 10 meters). I've talked
to three HAMS on 20 meters only to have to struggle just to get
them to recognize my callsign.

This brings up my question: Is it hopeless to run HF voice at 100 watts?

If I were to get a inverted V dipole up at 40' would I have the same
lousy luck? What cheap portable antenna would be most efficient?

I know two other HAMS who have recently gotten their general,
and both report lousy results on 20m-160m running 100watts.
Both live on third floor apartments using folded dipoles. Both rarely
are able to snag a QSO.

What about running mobile? A 6' whip should pale to a 60' dipole on 3d floor?
Seems 100 watts and a whip would be worse than hopeless.

Is 100 watts sufficient when the sunspot cycle picks up?

Are 20m-160m bands strictly the domain of the "big guns"
running 1500 watts, 100 foot towers, and monster beams?

If this is so, what is the minimum setup to operate effectively?

400 watts, 600 watts, 1000 watts?

30', 40', 60', 100', tower?

antennas?

One time I was transmitting with no signal present (i.e., carrier level
at 0) and temporarily removed the antenna connector. I was holding
one end of a coax jumper in my hand and there was a popping noise
as I received a few small RF burns on my finger. The radio output
level had jumped to almost full. Cycling the T/R switch made it
go away.

Very similar, eh?

The HTX-242 was announced a couple of months ago, so RS has apparently dropped the price on these units.

That would seem to be a reasonable price for the '212. I have had one since January '95 and have had no real problems. The squelch is not particularly well designed. I keep it set at half scale but there is an occasional "pop" and the tail (squelch stays open) is entirely too long when a repeater drops. I have used it daily for the past year and a half for my one hour (plus) commute to work. Quite rugged and with the large heatsink it runs cool. I did get the service plan - haven't need it yet. 73's...

I bought an IC-2000H last year to replace the MCX100 that had been
in the car. I've been pleased that the IC-2000 receiver is almost
as strong as the widespace receiver in the MCX100. The MCX100
could be taken to congested mountain top radio sites with no
crunch problem, the IC-2000H will crunch at a congested site.

Ken - Heath put out a special kit years ago to allow the rig to
tune the full 4 MHz of the 2 meter band. Without it, you could
only get any selected 2 MHz of band width. I have one I used for
Packet work until just recently where I retuned where the active
2MHz was centered but the PLL circuitry started acting up rather
badly with major drift problems so its now in the garage
awaiting another home. I also have the construction manual, but
unfortunately its in storage in another city. Sorry I couldn't help more.

Charles,

100 watts is sufficient for solid QSOs when the selected band is not too crowded and, of course, the
propagation is good. You might actually have a very strong signal, but with crowded band conditions and other
hams running 1000 watts it's hard to compete.

Of paramount importance, however, is an efficient antenna. Yes, an "inverted-v" dipole at 40 feet can make all
the difference in the world! For 75 and 40 meters they're great. For years I've used an "inverted-v" dipole on
75 meters mounted on my tower, and it has worked very well. At the higher frequencies you really need something
like a multiband yagi antenna or a quad, though. They not only boost your signal, but also attenuate unwanted
signals coming in from the sides and back of the antenna.

Many contacts can be made with relatively low power if you pick the right time and frequency. Also, under
adverse conditions, CW has often been a good mode for contacts.

Good luck, Charles.

73,
Lindsay

> antennas?

Charles,

First, congratulations on your recent upgrade. What is your callsign?

I run from 100 to 150 watts (depends on what kind of mood my old Hallicrafters SR-400A is in that day), and have had phenomenally good luck with it. I use a G5RV that I made myself, up at about 45 feet, through an MFJ mobile tuner (300 W rating.)

I rarely have any problem making a contact, and have even broke through my share of pileups. I have worked a fair bit of DX, including Antartica, Australia, New Zealand, Marshall Islands, and a few African stations, not to mention a ton of Europe, Caribbean and South America. And all of this within the last year, at the "bottom" of the sunspot cycle. Most of my contacts are on 75 or 20 meters, since my old rig has no WARC bands.

It really sounds like your antenna situation needs to be improved, and it will make all of the difference in the world.

I've had the power IC go on an AZDEN (twice), once on a Kenwood (and know a guy with the same 241 that has the thing blown twice).

In my opinion, those things just aren't reliable. I know that on the AZDEN, one failure was simply because the antenna wasn't hooked up on low power. That wouldn't have bothered a discrete unit.

Progress is wonderful -- of course, those things make the units much cheaper -- you can replace them if you can get them -- they tell me there are only a few major types. Jerry W8GND

Whenever you see a digit come across the display press the digit for
which when summed together to two equal ten. If you see a "3" coming
across press the "7" key and so forth. You'll see your score add up.

Hey, I didn't come up with this game...

Having put my Yaesu FT-50R through some transmit and receive measurements, I thought I'd post the results here. I only did power and sensitivity measurements, no selectivity tests. If I get a chance to do those, I'll post an update. I did all of the rx measurements in the NFM mode as the wide filter isn't wide enough for U.S. broadcast stations anyway, as previously posted by others.

John, N2BFJ

Yaesu FT50R Measured Performance Specs

Notes:

1. If your newsreader uses a font other than Courier, the charts below may appear out of alignment. Save this article as a text file and view with a text reader or editor.
2. No mods or adjustments were made to the test radio.
3. All measurements were performed using an IFR FM/AM-1600S service monitor
4. All transmit power measurements are in watts, except L1, which is in milliwatts.
5. All receive sensitivity measurements were done in the narrow band fm mode and are in microvolts for 12db SINAD.

From: lwyager@in.net
Message-ID: <4q2i1i$a7q@su3.in.net>
Source record: 199489

I have encountered a nagging problem with my 990 and I hope someone has run into the same thing or perhaps can offer some ideas on what it's source/cure is.
When running digital modes (rtty, pactor, amtor) the 990 will stop transmitting after approx 2 minutes, 20 seconds (+/- a few). The Kam+ is still indicating that it is transmitting as does the Kawin software. The 990, however, has switched to receive. This only happens on digital modes... key down time on cw into a dummy load is well past this time. The power output in all tests is about 10W.
So far I haven't been able to come up with an idea. Perhaps it's time to send it in for warranty service?
Any input will be greatly appreciated.

I took a closer look at the schematics, and my Th-79A the other day.
The 800Mhz parts are not installed on mine. SN# 70301168
They should be located under the small daughter board on the RF
(belt-clip) side of the rig when apart.

Component values are given on the schematic, but I am no brain
surgeon, and that's the kind of skill required to try and install the
parts yourself. Real small space to work with.

Hi Doug,

I've had stability problems with two 747 rigs I own, and hve had a hard
time fixing them.

They seem worse into a hi-Q load like a mobile antenna or an antenna
tuner.

I don't know if you are having the same problem or not. With mine, the
problem shows as RF output when the radio is in transmitt but no signal is
present. In both rigs, it is an oscillation in the AM broadcast band.

They don't do this into a dummy load.

If you consider the fact the 706 keyer doesn't work right, it has a
useless ratio contol described in the manual as a weight control, then
you're left with only number one.

I do however, like the six and two meter features of the 706.

Allan, What's wrong with having the neutral tied to the water pipes at the fuse box? Almost every house does!

You have a problem in the rig, not the house wiring. Your rig is unsafe. If you measure from each side of the power cord to the cabinet of the rig with the power switches on, I'll bet you find a ground fault.

>
>I think I listen to too many talk-radio psychologist shows...!
>

I deleted the original message that started this chain, which is
where my comments should have been, but here they are...

After the only ham in a family dies, the family likes to leave the
shack as-is for a while ("it makes me think of dad just to walk
into his radio room and look at it all"). After a while, they
might want to use the space for something else, or even get rid
of it to prevent worries about lightning strikes, etc. Non-hams
have odd thoughts about all those metal boxes!

You or someone else in a local club might also offer to help the
family in selling off some/all of the equipment. There is a guy
in our club who has done this for years; he is very friendly with
almost everyone in the club, so most of the XYLs know him. He
and another fellow go in and take inventory, then give the family
a list of sellable items and reasonable prices. Joe then puts
ads in local ham newsletters and sells *most* of it. He NEVER
takes a commision for himself, but does occasionally make a deal
with the family for something that the club could use: "If I can
sell the rig and tower, would you be willing to donate the antenna
to the local radio club?"

It may seem harsh or crude to offer to sell off the equipment, but
the family may be very grateful for your efforts. You can, of course,
buy some of the items yourself. I would tell them and also explain
how much it means to you to own some of your elmer's equipment.

>Electrolux and ham radio both have something in common, what?

OH BOY !! A Burt-a-Riddle from our resident HAM-A-ROID !!

Let's see, Burt, let me think about this for a second or two.

Electrolux has vacuum cleaners.
and
Ham Radio has Burt.

So if those two statements are both TRUE, then the obvious
conclusion would be:

Vacuum cleaners suck.
and
Burt sucks.

So there's your answer Burt. Electrolux and Ham Radio both have
something that SUCKS !!! Gee, I love a good Burt-A-Riddle.

Here's one for you Burt. Did your mother have any normal children ?

Besides that, maybe both those kids are smarter than you think. Maybe
their mothers told them never to take candy (or ham gear) from
wierdos. Could that be why you can't 'Give it away' ?

>This brings up my question: Is it hopeless to run HF voice at 100 watts?

No, it's not hopeless. Lot's of people run 100 watts on HF. But a few things to consider. First, the most important part of any HF station is the antenna. I take it you are using indoor antennas. Outside will work much better. Higher will work much better (to a point, but unless you get up to 200 feet, we won't worry about that now). With a dipole up 30 or 40 feet you should find plenty of people to talk to. Second, we are at the very bottom of a sunspot cycle right now. Which means HF propagation is about as bad as it ever gets. Wait five or six years and you will be able to work the world with an indoor antenna. Right now you need something outside.

In regards to only running a 100W, I basically only use 80-100W...
I run 7.251, 7.248, 14.305, 3847.5, 3945 in the mobile an at home.
At home I use a G5RV up about 40' with my IC-751 an Dentron Ant tunner.
I also work digital modes on 20, 40 & 80 at about 50W out due to the
heavy duty cycle on Pactor, Amtor & ect.

Its not so much the power, my mobile Atlas 210X only does 80-100w at
best, its how you get it to the antenna an type of antenna. The people
I talk with on a routine basis have no problem hearing me, even if I'm
not the strongest station they ever heard...

Your going to have to look hard at your antenna system, are re-consider
its layout or feed line or other factors which would apply...
I know this doesn't solve your problem, it just understates the fact
that a antenna system can either make or break you...

Just remember if your S-5 on a 100w, and if every time you double your
power you could come up 1 S unit; what would your signal be at 800W..?
100, 200, 400 & 800w Figure it out... Its not the difference of S-5 to
60/9... either.

There are some really sharp guys here on this newsgroup, an they will
probably have much better ideas on what you might need to do, than me.
Just don't give up...

Burt Fisher <k1oik@ccsnet.com> writes:

>The best selling book, "Hitler's Willing Executioners" by Daniel Jonah
>Goldhagen tells the story of how ordinary Germans (like hams) allowed
>the holocaust to take place. The author shows the ingrained deep hatred
>for Jews that Germans had for Jews before Hitler came to power and that
>there was a widely held shared view that the the Jews ought to be
>eliminated in some way from German society.

This is not correct. In fact, there was a hate against Jews in nearly
all countries of Europe before 1933, but it was limited. There were
many problems in Germany at the time Hitler came to power. They were
not more related to Jews as to anything else, but Hitler used the latent
hate in order to find an explanation of the problems of the time. Hitler
proposed himself as the saver from all the evils, his solution was
simple: all the problems came only from the Jews, therefore they have
to be discarded (later: eliminated). Hitler's hate against Jews IS NOT
the reason why he was so popular in Germany all the time, in all the
parts of the society. These reasons are more complex.

Twenty meters is a toughie--a lot of big stations hang out there.
But I've worked a lot of DX there with 75 watts and a lousy dipole
up about 40 feet.

Your antenna setup is pretty bad, and sunspots are lousy just now.
See what you can do about getting a better antenna up, and soon
we'll have better propagation. One hint: Try 15 meters. It's
a lot less crowded than 20, offers great DX and great ragchews,
and is more stable than 10 meters.

BTW, my "lousy dipole" is just two hunks of wire 34' long, fed with
ladder line and a cheap transmatch. It's not much, but it works.
Hope this helps! GL and 73!

Understood! I was just looking for a general guide to the prices, I bingo-carded data sheets some time ago.

: They are very nice filters, though, and I did a lot of work with them
: during the preparation of the RF Design/QEX article.

They get around the problem of finding a decent set of AM/SSB/CW bandwidths... Some of the SSB Ceramic jobs at 455kHz are not too bad (though not in this league) though there is nothing narrower available for CW. There are plenty of modest SSB filters on 9MHz, though the cheaper ones seem to be drying up, and again less availability of something on the same IF for CW. The KVG (MHz family are effectively priced out of the reach of an amateur kit builder, though they do offer a full set of filters suited to all the popular modes.

I've suggested the new Collins devices rather strongly to him, they will do the job nicely and lend a certain cachet, as Yaesu have been using... It would be possible to lay boards so that they could be optionally loaded with a ceramic SSB and AM filter as a low cost version which can later be upgraded with the mechanical filter (and a few different associated components) and the CW bandwidths added etc. There was a QEX article recently about a multiband HF transceiver based on his kits and the summing loop that G3ROO and myself did. He's wondering about a general coverage RX/amateur band TX kit that can be built to different levels, and I offered some help. With something like SD5000 Dmosfet based passive mixers, a decent synth based on his recent DDS board as the fine-resolution stage, and some care over low distortion in the IF and audio stages, I suspect it's not too difficult to create something noticably superior to the ready-built bells and whistles boxes, within the capabilities of most kit builders.

: If you and your friends wanted to do a group buy you could contact:

Snip

Hi Charles,

I Have been opperating with 100 watts since I got my licence with great
results. I use a G5RV on 80 and 40 meters and a R-7 Vertical on 40-10
meters. I Have worked Europe, Africa, South America and much of North
America on SSB, CW and RTTY/Pactor in the past 4 months. The Vertical
though not a *ideal* antenna takes up little room, has a small
footprint and does not have to be mounted very high (cushcraft
recomends at least 9 feet off the ground). Also I have found that when
all else fails you can almost always get a QSO going on CW.

Don't give up!!! Its' proably your antenna.

William E. Sabin (sabinw@crpl.cedar-rapids.lib.ia.us) wrote:

: The old filters were bigger, had more inserion loss, had more intermod
: problems and were not as rugged. I can't think of any way that the old
: filters are better, except that they may be available at flea markets.
: Even then, we need to be sure that they haven't been damaged in one way
: or another. The new models are really neat.

The old filters were designed in an age when bands were less crowded
and there was a lot less demand placed on RX intermod etc. Modern
improvements in mixer design have made crystal filters look inadequate!

Crystal filters, years ago often had major design oversights (by
today's standards) in that you'd often find transformer input structures
feeding their lattice structures where the input transformer core spoiled
the intermod performance. A case of spoiling ships for a ha'porth of tar.

Old mechanical filters from the likes of Collins, Kokusai, etc had
similar problems, different transducers were tried, and some of them were
pretty non-linear, giving poor intermod performance in advance of the
filtering function, though some were fairly good. Magnetostriction, piezo
electricity etc all were used.

As recent designs, I suspect that rather a lot of work will have
gone into keeping the new types linear. No doubt Bill can confirm.
Flea market availability is probably the only advantage, as Bill said,
though I never see any in the UK.

Cheers
David GM4ZNX

Charles,
In the passed year and a half I have worked about 110
countries and 48 states running 100 watts.
The antennas I used were a 40ft
dipole hanging vertically from a tree outside my apartment
window and a hamstick on my car. Somedays I made contacts
left and right. While other days it seemed nobody could hear
me. If you want to work the world on 100 watts all you need
is a little creativity and patience.

John

p.s. My 5th contact running 100 watts was Western Australia on
40m SSB!

Charles:
It won't tke you long in ham radio experience to realize that the most dollar per performance is in the antenna. You are presently working with antnnas that are in the region of 1-5% efficient. You won't get out very well with them. Does your apartment house have metal drain pipes, trees, balconies? A little innovation will make a world of difference. In college, I loaded up the campus 187' flagpole.

Hi Charles, this is not luck. This is a system designed to fail.
The percentage of energy not making it up out of your house has to
be in the 90s, probably in the high 90s. By all means get that
antenna up to 40 ft or higher. I regularly talk to New Zealand on
100w and a 102 ft dipole at 30 ft.

A lot of work has been done to linearize the mechanical filters. At Collins Radio in the mid-1960s, I helped to identify these problems and raise the warning flags. I did similar work with crystal filters, which had contamination problems that caused crazy kinds of intermod problems. The xtal filter vendors are pretty much aware of these problems nowadays and the importance of intermod distortion.

Try RT Systems in Huntsville, Alabama. They make the software and cable.
They also have a 1-800 number.

>Matt,

I've not been able to find the plug either. (I've checked lots of places, big/small and local/mail order...)

Yaesu sells an adapter for a reasonable price that lets you use a "standard" TNC cable. I bought one
of those and broke down and bought the Yaesu speaker/mic for my FT-10R. Yeah, it cost me more
than if I had waited until the "ring,ring,ring,pin" plug was available, but I've been using the radio for all
the things I bought it for and not waiting for a plug! :^)

Hi everyone,

I am looking for information about microwave trancivers that are able of carying a data link of about T1 line (1 - 2 mB/s TCP/IP, AX 25 or somethig like) in area of less than 10 km, line-of-sight. I have some points - these, sold my the 'Solution group' fo example, but would like to hear for other manufacturers/equipments. The goal of this is to link two ethernet networks in the city area.

Any suggestion is welcome.

Thanks, George.

4249. Help with Atlas 210x CW

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-18 00:00:00 UTC
From: scicon@ix.netcom.com
Message-ID: <4q6me5$itq@sjx-ixn3.ix.netcom.com>
Source record: 199296

I tried to build the 'remote CW transmit switch' described in the Atlas 210x manual.

The switch didn't work. When I opened the rig, I found out that two of the pins to the Ext. Osc. jack, pins 1 and 9, weren't hooked up to anything.

These pins are supposed to carry the +cw and cw gnd lines.

The rig doesn't appear to be modified, the lugs to these pins are very clean with no trace of solder on them.

I'd really like to build this switch because I use CW exclusivly.

Can any Atlas owners out there help?

Thanks

Dan KE6LBX

I have the two lower priced models. The low end model (no display) is very prone to being locked up with stray RF. On 20 meters I can't run more than about 40 watts. I use it with just the QRP rigs now.

Then I bought the next model up because it is supposed to be RF proof. I does a lot better but get locked up every now and then with RF. But it is far better than the low priced model. For the price, it's not bad.

The top end product is just a few more bells and whistles. Stick with the mid-range product.

Duffy - WB8NUT

4254. six meter coaxial filter

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-18 00:00:00 UTC
From: jgarver@ichips.intel.com
Message-ID: <4q6q8g$hdr@news.jf.intel.com>
Source record: 199301

My new Icom 706 is getting plastered with apparently intermod
when I turn my yagi anywhere near the channel 2 TV tower about
2 miles away. I have to keep the antenna sideways to it if
the preamp is on. The 706 is okay without the preamp on but
then sensitivity way down.
I've been looking at 50 Mhz coaxial cavity filter designs.
There was a coffee can filter posted a few years ago but it
claims to have a 3db loss. I have a silver plated 160 Mhz dual
cavity filter that I'm playing with. I took it apart and stacked
it end-to-end to make a long single cavity. By adding more
capacitance I think I can get it down to 50.15 Mhz. I don't
want it too narrow and am thinking of increasing the area of the
loop pickups. There isn't much design information on these
things in the popular ham publications, unfortunately.
From what I understand, these coaxial filters really represent
a one turn loop with series capacitance that is loose coupled
on both input and output. A real cavity would be much larger.

Ideally I would mount this thing at my antenna with a nice
pre-amp immediately behind it and just forget the IC-706 pre-amp
on six meters.

A nice opening on 6 meters to the East Coast last nite has
inspired me to be able to turn my beam somewhere other than
North-South.

Any ideas?

Your antenna is probably the problem...way too low. I worked 200 DXCC
countries using only a 20 meter dipole strung at 35 feet (NOT 7' !!) and
100 watts from 1993-95, the sunspot low. Get it up and you'll get out.
Best 73, de John, KI7JB.

If politics might have any sway with you tehn the ICOM is a better choice.

The reason is that Kenwood has recently started a new sales tactic that distributes to retail shops at truck stops, stereo stores, gas stations, and what have you. They are trying to increase their sales markedly. A number of hams are upset at this due to the obvious lack of concern that these new retail agents will have for license checking. This means that any old schmuck, CBer, or dope dealer has a new and easy method to obtain radios that transmit on the amateur bands.

Now if this matters to you, then you might want to purchase something else rather than a Kenwood product. I certainly won't do business with them until this sales tactic is changed.

Jim

Hi Wolfgang,

The names of German political parties do not concern me.
I must admit, however, I have not seen the word "socialist"
in the name of a party that did not practice it.

>Do you really think - that the US constitution . or something
>in your mind is the only garant for a stable democracy ?

No. The U.S. Constitution was flawed in its creation and its
inadequate protections have since been further weakened. As
for something in my mind, intellect is the only means by
which man achieves morality.

>Wonna heal the world by dictationship of rulez ?

Yes, rules which I call "moral law".

>Poor US people ....
>Maybe you still haven`t discovered that there are some kinds of
>Law-systems in the world ???
>And I think - that the national oriented parties in germany are -
>compared to the US republics - really harmless and social
>oriented parties ...

No socialist philosophy is harmless.

>You cannot compare the situation in the States (without having
>any idea of foreign history -) with other countrys.

Perhaps you're right. All I can do is to help others
understand why socialism is tyranny. That's a universal
truth.

>And the education - your government and TV applys to you - may
>not equal the present situation in any country.....

I agree. Socialism is practiced in many different ways.

>Socialists :
>
>This party is the reason why we have a good social system
>in our countrys - which cannot compared in any case with
>that one in the US .....

Social order was also strictly maintained in the Soviet Union,
but not by moral means.

>dipole at 7' in my first floor apartment (also a Carolina Bug Catcher
>sitting on mag mount on floor with two 30' folded counter poise wires).

It sounds like about right. You do not get much signal out into the
ether with these sorts of antennas indoor at low heights. You can
expect no more.

>This brings up my question: Is it hopeless to run HF voice at 100 watts?

Gee, just saying "HF" is silly in this context. It is hopeless to run
2 KW into a dummy load. It is very easy to run HF with 3 watts to a
good efficient dipole up 50 feet in the clear. Your antenna is the
single most important piece of equipment you have, you need a better
one!

>If I were to get a inverted V dipole up at 40' would I have the same
>lousy luck?

No. That is an easy question. That sort of antenna with 100 watts would
be really "easy" by many standards, too easy for many who like to run
very low power with simple antennas.

>What cheap portable antenna would be most efficient?

No such thing as a free lunch. You need to know this in your bones. It
is absolutely true and most important to know. No small antenna will
do anywhere near as well as a full sized one. No low antenna will do
nearly as well as one at a half wave above ground. Etc, etc.

>Both live on third floor apartments using folded dipoles. Both rarely
>are able to snag a QSO.

Same comments. They need an antenna. That is all.

>Seems 100 watts and a whip would be worse than hopeless.

Not always, but it is always less efficient than a full sized antenna.

>Is 100 watts sufficient when the sunspot cycle picks up?

It is sufficient anytime with a real antenna, etc etc.

>Are 20m-160m bands strictly the domain of the "big guns"
>running 1500 watts, 100 foot towers, and monster beams?

It is hard to tell if you are trying to flame bait here. Of course the answer is no. I can tell you about guys running 10 watts maximum PEP who are on the DXCC honor roll. I personally did WAS SSB on 40 meters with 5 watts PEP in about 2 months two years ago. I had a real antenna. A full sized dipole at 40 feet.

Good luck, if you really want the answers, they are out there.
Try a nearly invisible long wire with thin, thin wire into the trees outside as high as you can get it. Get / build an antenna tuner and you will have all bands with 100 feet of wire out there.

Hang in there, and pay some attention to what the other respondents suggest about improving your antenna system. 100 watts is plenty.

But here's something else to consider: It's a lot more important HOW you operate, and WHEN you operate, than what you're operating. You'll find that your results improve dramatically when you target your bands at the best time of the day for each band, relative both to your QTH and that of your target QSO.

You should be able to have some fun on Field Day....

4261. Kenwood TR7730 sale

Allen, I would suspect one of the tubes in the PA has failed while moving it about. A short from the plate or screen grid to the filament would cause the problem you mentioned. Pull the two PA tubes, replace the fuse, and power the rig up. If the fuse doesn't blow again, you should check/replace the PA tubes.

So this is an amateur radio newsgroup (rec.radio.amateur.equipment,
actually) set up to talk about amateur radio equipment. If you're
not interested in amateur radio equipment, why hang out here at all,
or direct your posts or followups here?

There are other groups for other subjects, social, political, and economic.
If you want to talk about that stuff, then go there and talk with people
that are reading/posting to that newsgroup to talk about that. They know
a lot more about those subjects, and can give you a much better
discussion.

That's the way that usenet is supposed to work, anyway.

Hello to ALL !
Does someone can recommend, where we could purchase a DC-DC converter,
12 V -> 24 V , 10,15 or 20 A output
(YES, i.e. from 12V to 24V !!! Not the popular 24->12V !)
Another alternative may be 12-> 12V converter with floating output ground.
A manufacturers name, product name, E-mail link, tel/fax will be appreciated.
Thanks, and BYE !

: It is a keyboard mod enclosed in the manual.

I don't know where Sam got the idea that the DJ-F1T mod is a "keyboard"
mod - it involves opening the radio and clipping the red wire. (The blue
wire is the "illegal" mod.) Once you get the radio back together, you have
to do a CPU reset (if memory serves, that's holding in the "F" key on the
side while turning on power). It works fine, as far as I can tell, though
I haven't used my DJ-F1T much since I got a DJ-580 a couple years ago.
(The DJ-F1T had gotten pretty beaten up through hard usage, and when the
"finals" went I decided I'd be better off with a new dual-band radio.)

BTW, the 580 uses the same colorcoding scheme on the mods, though getting
to the wires is a different procedure (take off the bottom plate rather
than the back).

73,
Clark

P.S. Doing the CPU reset erases all of the memories on either radio.
So, you might want to write down all the memory settings before you start.

From: markus@sp056
Message-ID: <Dt7tvu.989@news.cern.ch>
Source record: 199317

I'm going to assist the Widow of a late HAM to sell equipment.
She has no idea about the value of the items and I'm not very
sure about some of it either. Could some of you reply to me what
the think a fair price is ?

Here the list of the items:

- Icom IC-765 HF Transceiver, 2 years old
- Yaesu FT-901DM HF Transceiver
- Yaesu FT-221R 2m Transceiver
- ICOM IC-202S 2m SSB Transceiver
- Yaesu FT-209RH 2m Handy (incl NC-15 charger)
- JRC NRD-505 Receiver
- Trio CS-1577 30Mhz Oscilloscope
- HP 410C Vacuum Tube Voltmeter
- Arkay AV-20 Audio Voltmeter
- Leader LAG-120A Audio Generator
- Trio SG-402 RF Generator
- Heathkit HD-1250 Dip Meter
- WM M Nye Co Viking 3kW Antenna matching network
- Drake 2kW Antenna Match Box
- Waneco 1040R Audio Filtering Receiver

If you know about an item please send me a mail stating its (maybe
estimated) new price and age and what you think it could be worth
at a hamfest.
If you want to make an offer it you are welcome. Please bear in mind
that the stuff is in France, near Geneva. Shipping costs might be
considerable and international payment methods cumbersome.

Thanks Markus

How does the MFJ tuner "know" when you are on a higher band? I don't
see a switch on the MFJ tuner, or other means of communicating
to the tuner from the rig as Ten Tec does with their auto tuner.

> The Q of the new MFJ roller is over twice the Q of the Cardwell roller in

Just might do that, if I can figure out how if knows when
I leave the lower bands and go to 20 or higher in frequency.

Would a "complete" path around the case be able to constitue a
"shorted turn" around the internal roller inductor. This is the
only possible reason of which I might concieve.

> 73 Tom

Well, Tom, this morning I downloaded Paul's patent; he has the
patent granted in the US, Canada, and the UK. Obtained the
patent via the web's Shadow Patent Office, SPO, works pretty neat.
His US patent number is 4763087; applied for 27 May 1986; issued,
9 August 1988.

Anyway, my guess was correct. He has seven claims in the patent,
made after a VERY lengthy and wordy description of every combination
of components of which the world has ever conceived for "prior
art" T and Pi three element networks!

First claim: Again a very wordy description claiming the idea
of interconnecting--which really means reversing the network
between source and load connections.

Claim 2: The matching network applied may be a T network.

Claim 3: The matching network applied may be a Pi network.

(My paraphrasing of the claims; applied means between the
interconnecting (reversing) switch; the network can be
"turned around" with the swich such that the input T
arm capacitor, in the "switched" position is connected
to the output, and similarly, the output is connected
to the input.)

Claim 4: "A switch device for connecting an impedance
matching network....blah,blah) in such a way that the
interconnecting described is realized.

Claim 5: The switch device of 4, above, is capable of
by-passing the matching network such that the source is
directly connected to the load.

Claim 6: The switch device of 4 is capable of connecting
both source and load to ground, bypassing the network.

Claim 7: The switch device of 4 is capable of connecting
the input source to an alternative load, and the (original?)
load to ground.

The discussion part of the document describes that, when using a
T type network comprised of capacitors connected in series with
the source and the load, and "an interveneing inductor" to
ground, that the tuning, efficiency and power handling are
greatly improved when one of the capacitors is fixed, leaving
only two variable elements in the network, unlike any other
of the "older" network disgins described in the patent discussion.

Also, that such a fixed value reactive element assures that there is
ONE and ONLY ONE setting of the remaining capacitor and inductor
elements at which a conjugate impedance match can be obtaind
connecting the originl source and load impedances. Therefore,
the "prior-art" impedance matching networks with three variable
reactive elements "could be easily mis-tuned" which could result "in
excess network power loss, excess current, excess capacitor
voltages, and decreased bandwidth, thus increases in the
network losses and excessive current and voltage." I suppose this
means that low vswr values can be obtained with the three
variable element tuner, but that these values might not actually
be a "conjugate match", and therefore the deleterious conditions
listed would occur.

So, that is what I have learned so far, Tom. I am not sorry
I bought the XMatch tuner from Paul. He obviously has the design
well engineered, as he knows exactly what load ranges of load
impedances (Smith chart circles) his unit will match conjugately
to a 50 ohm source impedance. And he is correct, there is only
one single setting of the variable L and C elements that will reach
the match. I've already learned that. And it is very easy to
match my 160 thru 30 antennas with the device. It is a bit
more fussy on the higher bands, however. In fact, the network
must be "turned around" when going from the CW to the SSB portion
of the 20 meter band, for example; and tuning is only accomplished
with only a very small amount of inductance to ground; sort of
sensitive to get it just right. I was using way to much L
when I ran into the coil resonance problem you described

Of course, Paul calls the XMAtch the "Classic Lowbander" tuner,
so assume his design is only optimum for frequencies below
7.3 mHz.

Enough said about all this for now.

73, Jim, AH6NB

4273. Wanted: National NCX5 manual

They complain about for sale posts and do nothing to curb crap like below
from the news group!

xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

>I don't like socialists because those governments spend too
>much money but to say all socialists are fasists makes really
>no sense at all.

Enno, please read my other post and tell me which of the
characteristics that bind socialism to fascism you disagree
with. Socialism requires fascism (or at least the threat of
fascism) in order to enforce its demands on the individual.

>Remember you live in a FREE country unfortunately with a
>president that can act as dictator..... I think Germany and
>Dutch governments are much more democratic than the US will
>ever have.

This statement is symptomatic of the Big Lie of government.
Democracy has absolutely nothing to do with freedom or morality.
A democracy in which the majority consists of bigots intent on
destroying the minority could be just as terroristic and
repressive as any dictator.

>What is a country that prevents CB users to speak with other
>countries?

Your question outlines why, contrary to assertions elsewhere
in this thread, an understanding of these concepts is just as
relevant to Amateur Radio as to any other aspect of life.

If I recall, when putting in new tubes, other than the original manufacturer's parts, a cap had to be changed in the tank curcuit. I had to do the mod on my 101 a few years back after replacing the finals. Evedently the capacitance of the newer sweep tubes is different than what the rig was designed for. The changes are in the Fox-Tango news letter. If no one else lets you know the value and cap to change, let me know and I'll see if I can dig it out and send the mod to you.

From: stevehan@yrkpa.kias.com
Message-ID: <4q7c65$cud@ns2.ptd.net>
Source record: 199323

I'm thinking of ordering the FT-50 and hear of a couple think I want to verify before ordering.

- The addon the DVRS keypad, does it work as noted in the manual. I heard of complains that the answering machine mode does not work.

- During scan the unit beeps when it stops on a active channel. Can this beep be turned off. I dont like this option, I can turn it off in my current mobile unit. I know you can turn keypad beep off but wasing wondering about the scanning beep.

-Does the more expensive keypads have directory entry for the frequency or do you have to use the VFO to enter them.

Thanks,
Steve

4277. Re: Hopeless to run HF voice at 100 watts?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-18 00:00:00 UTC
From: wx8l@vtc.tacom.army.mil
Message-ID: <4q7avu$is4@vtc.tacom.army.mil>
Source record: 199324
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.misc

Clarks comments are valid here and sum it up. Let me add (and bear with me I'm checking into the thread late and it may have been said) the difference between 100 watts and 1000 is 10db. On 75 and 40 where signals typically run 20-40db over s-9 with a good antenna, you would still be 10-30db over s-9. Hardly a waste of time...

My Yaesu FT227RB (later model with scanning and more memories but still basically the same radio) would do something similar. When I would key the mike to transmit the L.E.D. display would change to a "0" (zero). I would have to turn the radio off and back on to get the frequency display back on again. I found it did this especially if the antenna was not set up correctly, i.e. high SWR condition. Was using an antenna in the ham shack. Has anyone had the same experience with the 227RB model? Does the same fix apply to that for the 227R and 227RA models? Right now the rig is working okay but would like to file this good info for future possible repairs. I still love the radio and have had it since I bought it new in 1978. Has great intermod rejection compared to newer HT's and compact rigs.

I would like to thank everyone who helped me find a local testing site.
I passed the tech+ exams and now need help again.

I don't have any good info regarding recommendations for a reliable,
simple 2m (possibly 2m/70cm) HT. Not something real expensive and full
of "features". I don't even know what "features" are really needed.

I'm not a total technical idiot, just overwhelmed by the number of
models. It seems as if Alinco makes simpler radios than some of the
others.

I would like to be able to plug in an external power supply, and connect
a remote antenna.

Any help is much appreciated. Thanks.

(I'll list my call sign when I know what it is)

You are right,Burt. I work at a collage and young people are not only more challenged by using computers, thay make way more money with the skills they develop from using computers. Todays life style requires that they hit the bricks running in order to make a living. Ham Radio no longer offers thoses skills to a young person. Electronic component level trouble shooting is for the most part over. Ham Radio was a major feed for people who went into electronics with this skill. Few school teach it, and even fewer company want to take the time to deal with it, or pay fore it. Swap the board is all it takes and the equipment will tell you what to change. No money in it, us less you work for the government.

The students I meet who get big money, fast, do it in networking software, not with a microphone. I have out lived ham radio and the fun of electronic repair and had my electronic career change severl times to the point that it is not fun now.

I sold all of my ham equipment not because of electronics, but because of the type of foolish answers to your post, is also the type of foolishness ham radio has gone to. I know many good hams who have done the same as I have, an there will be many more to follow.

I will be blasted by many, but I have not even looked at this group in a long, long time, but your post did make me want to respond. You should have given them a computer and they would have tore your arm off taking it. They know what it take to live now, and ham radio dose not provide it.
Jim, WA7NDD.

We've used the Persoft Wireless Bridge for this purpose; we usually use several of them to link several individual ethernet networks to a "main" network with a gigantic database server, etc. They make units operating in the 900 and 2400 MHz bands. Persoft is located in Madison, Wisconsin and their web site is at http://www.persoft.com/.

4287. IC-2340H Fix for UHF Switch problems

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-18 00:00:00 UTC
From: SteveP@Dartmouth.edu
Message-ID: <SteveP-1806962209400001@ka2-53.dartmouth.edu>
Source record: 199334

To all IC-2340H owners.

This is a post describing a FIX for some a simple mechanical problem.

I've had some problems with the front panel controls. They seemed to fail one-by-one after being mobile in my truck for about a year. The UHF side went first, first losing the channel control, and then the reverse function on the volume knob, and then the band-select function. They failed slowly, one at a time so I thought the problem was mechanical failure of the switches. (hot car, vibration failure, etc)
Unfortunately, after taking the unit apart, and testing it, the switches were fine. BUT I DID DISCOVER THE PROBLEM AND IT WAS MECHANICAL!

The connections from the front of the unit are made via a SMT mating conector made of plastic. The solder joint was not very strong on the RADIO SIDE, and I popped the whole connector off after touching it with a Q-tip. My guess is that the factory was cautious in not applying too much heat to the solder joints near the plastic connector in fear of melting it. The fix is simple...

Pop the connector off, note polarization, place a little rosin flux on the strips of little connectors, and place the connector back. Resolder the joints carefully with an iron. By touching only for a few seconds, I got a nice solid joint, and the radio now works fine again. I could've used a SMT station I had access to, but the iron works fine. Just make sure you have a *really* small tip.

If you're wondering how to get the knobs off the front of the pots/encoder swtiches, just pull *real* hard (but carefully). The daughter board can be removed from the front panel assembly by unscrewing two retaining screws on the potentiometer axes. You then have full access to the mating connector which may be the troublemaker.

Hope this helps someone - took me a few weeks of research, and a lot of fiddling to find it out.
FYI, my radio serial number is 01887.
Please let me know if you've had siimilar problems, and if this helps.

> If you want the best hf mobile, go for the DX-70 (or FT-900).
> If you want bells (or whistles), then it has to be the IC-706.

An interesting way to put it. While the 706 seems to be an okay rig (I don't own one, but know several who do) when I decided to get a small, mobileable HF rig with a remoteable control head, I found the DX-70T to fit my needs best. The FT-900 is overall probably a better radio, but the additional expense ruled it out for me at the moment. I certainly considered the 706, but the HF receiver didn't seem to be as nice as the DX-70s (for SSB, at least - I think both rigs aren't so great on CW) and the 2m side seemed very intermod-prone. Since it was really HF I was interested in, I bought the DX-70, and have been quite happy with it, even with its shortcomings - one example being dip switches (*ugh*) to set the PL tone, etc. Since I mainly bought it for SSB, not FM, this was a minor thing to me, but to some it might rule the DX-70T out.

All in all, I thought the DX-70T was the best value for me, but of course if your station requirements (mode, etc.) are different, that might make the answer quite different for you. If possible, find some friends with a couple of these different kinds of rigs and try them for yourselves, using the modes and operating methods that you normally use.

Good luck in finding a rig that you're happy with!

Hello,
In a few weeks my family will be traveling across the western half of the US as we have many times in the past. We love to listen to radio stations wherever we travel but one disappointment is that we have trouble picking up stations except when we are right in or near a city. Is there a brand of radio or type of antenna that we should invest in that would be better than what came in our van when we purchased it? When we talk to local commercial car radio stores, they just want to sell us wonderful sound systems with great speakers. We want receiving capabilities, not woofers!! Any help will be appreciated. Thanks. barb

(snip).....
> dipole at 7' in my first floor apartment (also a Carolina Bug Catcher
> sitting on mag mount on floor

In all reality, no eggageration here, 5 Watts on an average dipole up 50 feet will outperform your indoor antennas, even if you had 600 Watts out. Indoor antennas hung from the cieling and thrown on the floor will only give you results in those exceptional circumstances of very good propagation, and no pileups. That doesn't happen much currently. If you can manage a verticle, The Cushcraft R-5 (recently discontinued, but still available from stock) is the cheapest of the lot ($278), and over here, it performs very well on 20M. Neck & neck w/ my G5RV at 50 feet. They take turns in which performs better, but always are close. R-5 mounted only at roof level, and I'm in a valley surrounded by trees. Just talked to Bosnia Herzegovina and Azores Islands on it with 57 report with 100W. In fact with the Bosnia station, I could only get through on the R-5. Maybe you can sneak one up on your roof if you're nice to the landlord??? -- only 17 feet tall and not bad looking. Best of luck. 73, N1SQJ, Rick

>jimc1790@aol.com

Ok try this.

1. Select desired band

2. Press (Func + Set)

3. Press RPT button (by itself)

4. Use Rotary Knob to select new offset

5. Press the V/M button to return

Hope this helps!

>...and the point of my posting was that this is not a valid generalization.
>More and more hams are finding that commercial gear has its advantages.

What's the difference between commercial gear and ham gear? Ham gear
can be field programmed for frequencies, commercial gear (by law) cannot.

That's the end of mandatory differences.

Practical differences include things like:

* commercial gear is usually very rugged, much more so than typical
amateur gear.

* commercial gear is often used in close proximity to other transmitters,
and the receivers are extrememly strong and tight.

So, the trade off is

easy frequency selection VS. very rugged, excellent receiver

Lately the amateur gear has been claiming to be rugged, with good
receivers..... commercial gear has always been this way. Terrific
for packet, repeaters, remote bases, emergency back-up radios...

My advice for what it's worth.

Listen a lot. If the signal your receiving is strong then
they should be able to hear you even with an inefficient antenna
at your end.

Listen a lot and learn what band is open when. Sunspot low now
so 40m will be dead sometimes.

Try CW on 40m.

Think about better antennas.

I've worked into North Africa from the South Pacific on
75 phone with a measured 30Watts PEP output. THis is
halfway around the world. It's all in the antenna.

4309. FT2400/7400 Backlight Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-19 00:00:00 UTC
From: ernurse@ix.netcom.com
Message-ID: <4q96mv$6s9@sjx-ixn6.ix.netcom.com>
Source record: 199216

Hi all, thanks for reading.

I am have a problem with the backlighting on my Yaesu FT7400. This is a UHF version of the FT2400, and the radios are virtually identical. I sent the radio in to Yaesu for service for an unrelated problem recently which they fixed. Unfortunately, they managed to cause a *new* problem which I will describe:

What is supposed to happen is this: When the radio is brought into a bright light situation, a photo cell takes not of ambient light and brights the display backlighting to give more contrast. When the radio is brought into a dark environment (like a car at night) the photocell causes the display backlight to be dimmed somewhat so the light does not provide an overly bright distraction.

What now happens with my radio is this: When brought into a dark environment, the backlighting display dims down to *NO* light at all, so the display can't be seen at all in the dark. Now I also have an FT2400 right next to the 7400. The 2 displays are identical in brightness in the light so I don't think any bulbs are burned out or missing.

I don't really want to send this back to Yaesu and give them the opportunity to screw something else up, so has this unusual situation ever occurred with anyone reading? Is there a pot adjustment somewhere that can be turned? I'd be most appreciative of your experiences.

Thanks again, and take care all.....

>
> antennas?

Hi Charles. The sunspot cycle is at or near its low point for the cycle,
so the upper bands are very poor -- I suspect this is part of your
problem -- as it is with the rest of us.

Second the power out is not anywhere near as important as your antenna.
And No you don't need a huge tower and a beam. Several of us here in San
Diego with antenna restrictions have Cushcraft and Hy-Gain antennas such

as the R5, R7 and DX-77 and are quite successful at working DX when the bands are open. These antennas are mounted at 6 to 10 feet off the ground and since they are "half wave end fed antennas" they work quite well without radials. These verticals have a good low angle of radiation for DXing.

One of our group on the San Diego DX Cluster has worked 104 countries with 6 watts and an R5. These may sound "incredible" unless you have tried it, turns out from 6 Watts to 96 watts is about 12 dB or roughly 2 S-units. So the 6 watter compared to the 100 watter is down 2 S-units or so. With 6 watts, several 10,000 mile plus contacts and QSL cards are in the log.

For dipoles, inverted Vees and beams -- you need to get em up in the air, as the radiation patterns are strongly influenced by height. In general, the higher these antennas are -- the lower the radiation pattern. That is why the big towers for the beams and dipoles. Note that a properly designed vertical can work well at or near ground level.

And no, the 160-20M bands are not the exclusive territory of the "Big Guns". I know several DXers who have worked DXCC with 100 watts and antennas at 40 + feet as well as DXCC with 6 watts and a vertical as mentioned before.

During the last hours of a contest or the last days of a big DXpedition, many times the DX is begging for contacts --- easy pickins.

So hang in there -- when the sunspot cycle starts to pick up, you can work 10M DX with a wet noodle and a coupla watts. I know of one DXer who loaded up his rain gutters and worked many Asian African and Europeans on 10 Meters.

From: turner@safety.ics.uci.edu
Message-ID: <4q99c4$p86@safety.ics.uci.edu>
Source record: 199220

Solved. I called MFJ this morning. It is "about $55" for the new air roller. The fellow there said that it should mount up to my Differential T inductor mounts, but I would need to drill two new holes on the bottom of the case to do it. Sounded fine to me, I ordered one.

Anyone want an MFJ roller inductor from a Differential T tuner? I will soon have a spare. Mine is just fine, I always used my Murch with Johnson roller inductor (on ceramic core) when the amplifier went on :-) .

> Any ideas?
>
> Jim WA7LDV

Hi Jim!

What might help that would be a little less ambitious is an OLD R.L.Drake TV-1000-LP lowpass filter made in the late '60s.

These had a 52 MHz cutoff frequency and lots of attenuation at TV channel 2. Remember that Drake sold TR-6 transceivers and TC-6 transmitting convertors that made 100W of 6 meter output back then.

I grew up in Dayton, OH where channel 2 TVI into the 6 meter receiver was commonplace. Double ballanced mixer (hi input IP) receivers were the only good help for this other than the TV-1000-LP filters.

Note that we couldn't give a rat about the neighbor's TV, it was our receivers that we were worried about.

Another solution is to make a notch filter for 55.25 MHz to lower the strength of the video carrier. Make one by using a Tee connector in series with the antenna line. At the third port, connect a small value capacitor in series with a nearly quarter-wave (@55.25 MHz) piece of coax (the bigger, the higher the Q) shorted at the far end.

The closer the shorted section is to 1/4 wave and the smaller the capacitor, the less "coupled" the "suck-out" will be and the narrower the effective frequency range of the notch. Notch depth is less with lower coupling, but is a strong function of the unloaded Q of the 1/4 wave line.

The notch resonator will always be less than 1/4 wave. How much less is a function of how "hard" the resonator is coupled to the line.

Ideally the "small" capacitor would be totally enclosed by the outer conductor of the coax resonator/Tee-junction combination. Maybe a small hole in the outer conductor for fine-tuning a variable element.

This notch is extemely easy to build IF you have some sort of network analyser or sweep generator to play with: It's iterative. You can also do it by trial and error, but don't come looking for me if you do.

Hope this helps.

Mike Valentine - EM79sd JRC JST-245 + 2 x 3-500z + M^2 9el@120'
wa8msf@ix.netcom.com

One more thought: Maybe you could find a cable TV channel dropping filter that is designed to prevent subscribers from watching premium services if only subscribing to basic rates. I think KD1DU has a source. It could be tuned for channel 2! Sign up to the w6yx.stanford.edu VHF relector for more info.

Come on, Burt, don't be silly. You are giving up argumentative territory
by and by, territory that you never really had covered by arguments or
facts, just by hearsay from a book, that poses for a summary of facts,
which it is not, as it selectively ignores all those facts that would have
made it objective .... and a non seller.

To sell, the book had to be sensational, o r in the words of review
published about Goldhagen's book in the British magazine "The Economist":
An irresponsible way of bending facts

.... and certainly not what you would expect from a Harvard professor.

I took the liberty to send you that book review from The Economist by
snail mail.... But then Burt, I would want you to think about this:

What Burt says about Germans,
tells much about Burt
but hardly anything about Germans.

Burt, if you have brains between your ears, then stop this thread. You
already transgressed from being a misinformed simple mind into making a
fool of yourself to best of your ability. Only oxen and mules are this
stubborn in holding on to a losing position. I never would have expected
that from an intelligent being.

Siegfried, KB2YVC

Is there intelligent life in outer space? Yes, of course there is,
and testament to that is the fact that they simply not waste their
time with establishing contact with us...

We need more information...the name of the radio's model, like MICOR, MT500, HT220, MOCOM 70, etcetera, and the _full_ model number, which will look (for all but very old Motorolas) like L43GGB-1100A. The rest of the model number will tell us which series transmitter and receiver you have. The frequency they're currently on will be helpful, as well.

Most crystal-controlled Motorolas will convert pretty easily into the ham bands; synthesized radios may or may not, depending on the series of radio. It's usually a matter of retuning.

4322. FT50R EASY CELL REC

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-19 00:00:00 UTC
From: wm8p@infinet.com
Message-ID: <4q9qqp$69@news1.infinet.com>
Source record: 199229

HELLO FT50R OWNERS,

TRY THIS:
ENTER 778.8MHZ IN MEMORY L1.
ENTER 803.8MHZ IN MEMORY U1.

NOW YOU CAN SCAN BETWEEN OR MANUAL TUNE BETWEEN THESE TWO FREQUENCY LIMITS.
(SEE YOUR MANUAL FOR DETAILS)
THESE ARE THE IMAGE FREQUENCIES OF THE BLOCKED CELL BAND.
THE SELECTIVITY AT THIS RANGE IS SUCH THAT I CAN HEAR 95% OF WHAT I HEAR ON AN AOR8000.

FOR INQUIRING MINDS HERE IS WHAT IS HAPPENING.

VFO SIGNAL TO MIXER= 823.9MHZ
SUBTRACTIVE MIXING -45.1MHZ (1ST IF FREQ)
RECEIVED SIGNAL = 778.8MHZ [DISPLAYED FREQ]

VFO SIGNAL TO MIXER= 823.9MHZ
ADDITIVE MIXING +45.1MHZ (1ST IF FREQ)
RECEIVED SIGNAL = 869.0MHZ [IMAGE FREQ]

THE MIXER PERFORMS BOTH FUNCTIONS AUTOMATICALLY.

UNTIL THE SOFTWARE AND CONNECTOR PLUG IS AVAILABLE THIS PERFORMS QUITE WELL.
SO WELL IN FACT I WONDER IF ITS WORTH GOING TO BE WORTH THE TROUBLE TO HACK.

I WOULD APPRECIATE IF YOU WOULD REPLY TO THIS POST HOW WELL THIS WORKS IN YOUR LOCATION.

HAVE FUN.

I have always used International Crystal. I think they are in Oklahoma City. Give them the channel element number (should be KXN1024) and they should be able to take it from there. You could also send them the channel element and they will put the crystal in and compensate it for a slight additional charge. I'm assuming you have the channel element(s). If not you should find tham at most hamfests for about $5 or $10 ea.

Western Multiplex makes a 900 Mhz SS system that is designed specifically
for DS1 (T1) interface. The product is called Linx (or Lynx..or some
spelling variation of that...)

Very good points, which is why I am in favor of the NII proposal at 5 GHz, even though the current NPRM doesn't go far enough in my mind. Hams are in an excellent position to provide NII links, and something like that might breathe new life into the hobby.

Unfortunately, the ARRL will do it's usual short-sighted knee-jerk and try to kill it, even though that will be just another nail in our hobby's coffin.

I got the Adms softwear and cable from RT Systems and put the radio into the European mode. Everthing works great. But how do you get it back into the American mode??? I tried the full CPU reset as described in the back of the manuel and everthing I could think of and no luck. I did discover how to screw up the squelch setting for the VHF side, lucky I wrote down the settings first.

> about all the bells and whistles for almost HALF the price of some other
> brands.
> N3SQY

(stuff snipped from above) ...

With the Kenwood TM241A and the Yaesu FT2200 at $259.95, and the Icom
IC-2000H at $279.95 ... and the ADI AR-146 (a real sleeper of a radio!)
at $249.95 ... decide what's half the price of what!

You can buy an Alinco DR-605T for well under $500.00 ... THAT would make
the RS radio half that price, but wouldn't be a dual band (2/440) radio!

4336. Best base antenna for 706?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-19 00:00:00 UTC
From: Darren Ream <dream@post.cis.smu.edu>
Message-ID: <31C87015.4DBE@post.cis.smu.edu>
Source record: 199243

I just bought a 706 and need to buy a base antenna to go with it. I plan to use it for 2m, 6m, and 10m, and will mount it on my roof w/o a rotor. At this point, I think it's come down to one of two choices: a) an MFJ 1798 which has 2m through 80m, or b) a Comet ca-350db which is for 10m and 6m only and then mounting a separate vertical for 2m. If the perfomance of the MFJ is decent on 2m and about as good as the Comet on 6 and 10, I'd prefer to go with the MFJ as it is lots cheaper than the Comet + a separate 2m ant. and it can serve as a full-blown HF antenna when I upgrade to general. On the other hand, if the Comet is significantly better on 6 and 10, I'd rather go with it and worry about HF later.
Does anyone have any comments on either antenna or what I should do?
Thanks,
Darren, KC5OUH

>Is it hopeless to run HF voice at 100 watts?
>My luck has been rotten...

Power is not your problem, it's your antenna. I've worked over 150 countries with 100 watts and a dipole, almost all on 20 meter SSB. However, the dipole was up around 25 feet, pretty much in the clear. Remember, 1000 watts is only 10 dB more than 100 watts, and one S-Unit is 6 dB. That KW will only buy you about 1.5 S-Units. Your best bet is some sort of "stealth" antenna. You can make a dipole out of very thin magnet wire, using clear plastic rods as center and end insulators and black twine for support; it's the next best thing to invisible. Or maybe a 1/4 wave vertical up a tree trunk, with a good ground rod at the base. Not ideal, but lots better than your indoor ant. Just get something outside and up a little, and you'll do lots better. Best of luck. 73...

>30', 40', 60', 100', tower?

>antennas?

I run 100 watts ssb on 40 meters ,and dont have many problems in
daylight hours.I use an inverted vee up at 30 feet.My 30 years
experience tells me that your choice of 20 meters is a poor one. This
is known as kilowatt alley, plus people on 20 only listen for 59
sigs.Your antenna selection needs to be improved : as in get it
outside and up in the air if possible.I dont operate 160 meters
because I dont have the required 40 acres to get a half wavelength
antenna up, and you shouldnt either.Ten meters is good but isnt open
much in this sunspot cycle.I would try 15 meters or 40 meters with the
proper length antenna if possible.Even just getting that antenna up

and outside and resonant will do wonders . even on 20 meters.

I worked my first hundred countries with a hundred watts to a set of rain gutters! This was about 3 years ago with SFIs around 100. With conditions as they are, even a kilowatt and a beam can be tough!

Is 10k too far for a laser link? I seem to remember seeing an add
for one of these and it being cheap and not requiring a licence.
Dont know how far it would go though. Not much use in fog as well
I expect.

> What tubes can substitute for the 8950?

Hi Tom here... We used to go the other way around swapping a pair of 6JS6C's for a pair of 8950's...

In order to sub a 6JS6C for a 8950, you would need to provide 6V for the filaments VS the 12V used on 8950's filaments an pin 6 of the 6JS6C needs to be grounded... On rigs like the FT-101 series radio, it was simple an easily done by a little re-wiring of the tube sockets...

The 6JS6C's don't put out the same amount of power, about 60w per tube... 6JS6C's are easier to find than good 8950's
Hope this helps...

I take it you have never been to a hamfest, or an Amature Radio Store....?
There is more Rigs being sold to CBers' an what not, than you could ever
keep track of. If you ever listen on 80, you would know who owns an sells
CB an ham equiptment in Tenna, Ky & Ga... I have never been asked for my
Ham license, just my drivers license when buying by check... Kenwood is
just getting in on what Yaesu started 30 years ago... The 101 plain an
all its followers up to the Late 101E's models had 11 meters in them from
the get go... Just clip a wire, add the Am filter an go for it... The
A.E.S. company used to sell the additional X-tals for 26.000 - 28.000
coverage at the same time, they would sell you the rig...

Aside from that: with all the No-coders, alot of them are truck drivers.
They are just openning a broader market, an if you listen to 20 mtrs,
you would hear a lot of 18 wheelers with calls, probably even a few
legal ones..? It might make it more competitive, which could <?> mean
a little price dropping..?

But back to the original question: 450 or IC-706 which one???
For actual mobile usage the 706 will hold up better, for home
use the 450 is a better choice... Remember when you shrink them
down to the TS-50 an IC 706, there is a hell of a lot less radio
to dissapate 100W's of heat from a long winded rag chew... I have
repaired 2 706's for overheat related failures... In one the traces
lifted an broke at the power trans. The other had Tx regulator failure

trans actually cooked an fell apart....

So much for my input.

I am very new to the hobby of Ham Radio so I am having a little trouble with my new HT.

*When should I use the encode and decode Pl Tone on my HT.

*I now that a repeater sometimes requires a PL
Tone encode but when would I use the decode or the T Sql vs just The T.

*How do I use the paging function on this unit and exactly what does it do?

*I have read about doing B # while powering up and this expands the recieving on this unit but exactly what frequency really recieve. My dial now reads 50-999mhz. Can I recieve on these. Can I monitor 6meters?

*Does anyone have anymore tidbits on the expanded capabilities of this unit.

Thanks for all the help and hopefully when I become more experienced with my new radio I can help someone eles at that is just starting.

I personally really like my 212. I wish RS would come out with a dual bander.

My 212 has everything I need in one package. I bought it used for $200.00. $If you wait a little while, if I know RS like I think I do, if you wait about a month it will probably go below $200.00.

It is the same radio with two added features. First, it has 41 memories instead of the 31 that the 212 has. Also, the 242 has the ability to save out of band freqs in memory. The 212 does not have that ability at all. Otherwise, they are identical. As for how they work, I've had a 212 for several months now and i can't complain. It comes with just about all the bells and whistles for almost HALF the price of some other brands. You might consider getting the extended warrenty though, just incase all the bugs arent' worked out of the design yet. Remember what happened to early htx-202 when used with 12v with the battery on!

The keypad and scanning beep are one and the same. Shutting off the keypad
beep also shuts off the scan beep.

> -Does the more expensive keypads have directory entry for the frequency

Even the standard keypad on the FT-50 allows direct frequency entry.

I like mine!

>ethernet networks in the city area.

Personaly I like the WyLan Hopper Plus units. They work on 900 MHZ spread
spectrum and the factory ones should handle the area you specify (Just).
Configuration of the units depends on how you are planning to set up:

Example 1: Multiple Slave Units, Central Hub, 1.544 Mb/s 802.2

```
I-----------------------------10km-------------------------I
S S

S

H S

S S S S

S S S
```

Example 2: Network Link, 2 networks linked via repeater Unit (765kb/s)

```
I--------7km----------I-------------7km-----------I
N R N
```

Example 3: Multiple Network Link, 3+ networks, linked via repeater (765kb/s)

```
I--------------------14km-----------------------------I
-N R N
I
I
I
I
I
7km
I
I
I
```

I
I
- N

The Wy-Lan Hopper Plus units are quite flexible and work Point to Multi-Point or Point to Point with only minor changes. Price Runs about $2500 per unit and no FCC License is required to operate them. Antennas for these units are quite small and they can be placed just about anywhere. Line of Sight is neccesary for operation though. If you need some more information, feel free to contact ray at our office for more information.

>
> antennas?

Hi Charles,

I empathize with trying to operate HF from an apartment location. I
would try all means to get an antenna outside, if at all possible. There
are several interesting articles posted on the web that speak to
'clandestine' wire antennas.

If that is not an option, I would suggest something like the AEA Isoloop. While it is a compromise, it will allow you to make contacts on HF at the 100 watt level. If you disguise it right, it will look like a bird feeder and you can hang it outside a patio door. Of course, as in most antennas, higher is better.

I'd stay off 20 meter ssb while in the apartment. Usually you will generate tons of RFI that your neighbors will just not appreciate. Also, you'll need to monitor your VCR when your on 80 meters. Try 20 meter CW running QRP at night and you'll do well and you won't bug your neighbors

(and your apt. manager won't bug you ;))

Good Luck es 73

From: n5zgt@swcp.com
Message-ID: <4q92jm$r4f@sloth.swcp.com>
Source record: 199362

100 watts is MORE than enough for solid QSOs! Remember...the #1
thing you should be worried about is your antenna (height, type,
etc.). Don't get bummed over some hard times. Keep at it! Also, you
obviously upgraded, so why not use your CW privleges? You would get
far better results with CW, which is in my opinion the best and
funnest mode in Amateur Radio.
To prove it...I run both high power stations (100 watts), and QRP
stations (0 - 5 watts). I have made contacts all over the country and
world with an MFJ-9020 QRP rig on 20 meters with 5 watts using just a
dipole up 15 feet. I have also made contacts and received awards on a
NorCal 49'er 40 meter QRP XCVR the fits in a metal Altoids mint box,
with its 9 volt battery, and it puts out only 250 MILLIWATTS!
So it can be done. Try CW. Try getting a better antenna. But
don't give up!
Best of 73,
Brian, N5ZGT

PS - If anybody says you need to get an amp, YOU DON'T. It doesn't
take a whole lot of power to talk around the world as you read above.
I will never put an amp in my station because I can do the same things
with it with 100 watts, 5 watts and 250 milliwatts! Good luck!

I would suggest to you that the two radios are not comparable; they are designed to meet different needs.

The 450S is about the largest radio you'd want to take mobile; it is really more of a portable than a mobile, due to its size. On the other hand, it is absolutely full-featured, and makes a nearly no-compromise base station radio. It does not, of course, offer VHF.

The 706 is an adequate HF radio, but the receiver has certain drawbacks due to its design. Additionally, the radio's menu/controls are generally agreed to be hard to use since there are layers of menus in place of front panel controls. The 706 offers 6/2Ms, which is a huge plus for many hams.

I just made the same comparisons you are making; I chose the Yaesu FT-900. It is smaller by far than the 450S, has about the same capabilities as a base station radio, and has a detachable front panel. It does not, like the 450, offer VHF, as does the 706.

Has anyone tried using any of the Yaesu programming software (ADMS-1C, etc) on a Macintosh running SoftWindows?

I'm a Mac person (no flames please, I'm quite happy, thanks), don't own a PC yet (need to pick up a cheap 386 for radio stuff), and haven't had success with other serial-port intensive stuff (ie: Motorola RSS). I was wondering if I'll be able to get by using SoftWindows for more than just configuring.

With Motorola RSS, I can read files, edit files, save files, etc... But reading or writing radios has always been unsuccessful. I'm hoping the Yaesu will be different.

4362. Kenwood TR-2600A question

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-20 00:00:00 UTC
From: Chris Davis <cdavis@ptel.net>
Message-ID: <01bb5e5b.73cbedc0$0c5c09ce@cdavis>
Source record: 199166

I just received a Kenwood TR-2600A (an older HT) and was wondering...

The manual says it is "capable of tuning from 140.000 thru 159.995 MHz..."
The radio will only let me enter frequencies of 140.000 to 148.995. Is
there something else I need to do? (According to the instructions, all I
need to do is enter the frequency, without the first digit, since it's
assumed to be a one. This radio assumes the first two digits are
one-four, and only lets me enter the last four digits of the frequency.)

I just thought it would be nice to hear the police calls!

BTW, I'm taking my exam next Tuesday (aiming for Tech+), so wish me luck!

Chris

4363. Re: Info Needed: Mods for Alinco DJ-F1 HT

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-20 00:00:00 UTC
From: rmwatson@eskimo.com
Message-ID: <DtAqpL.LGF@eskimo.com>
Source record: 199167

Thanks to everybody that has replied regarding this original post. I was playing around with the radio, and it does seem to have the modification already, so I dont have to mess with it any further.

(Whomever owned it before me did BOTH modifications, so I have tx from about 139 Mc - 173.995 Mc.) Of course this was done into a dummy load......

I think the manual says after the RX modification, that I should be able to receive from 118Mc-136Mc, BUT I am at this time only to receive from 130Mc up to 173.995Mc. Is there a reason for this, or possibly the modification was performed on the TX only, and not on the RX. Further examination may be in order.

Thanks again and 73

Robert/KJ7BO

uuencoded GIF image of 800 mod for W31A. Not a very good image, but if you are capable of doing the mod, you should be able to figure it out. This mod should not be used on radios used in the US as it enables cell receive and opens up transmit a bunch.

Date: 1996-06-20 00:00:00 UTC
From: nk30@alux3.cnet.att.com
Message-ID: <4qboii$qea@nntpb.cb.lucent.com>
Source record: 199172
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

Has anyone built the automatic antenna tuner AT-11?

I am looking for input on how well it works.

Does it have enough protection for the transmitter while it is
selecting a match or does it simply rely on the pa design limits?

I am looking for a project to build and this would be useful.

Comments?

Jeff

Message-ID: <4qbo13$s28@brokaw.comm.mot.com>
Source record: 199174

I did the B# trick too, but my W31A only goes up to 799.9 mHz. Did you do anything else to get it to go up to 999?
Mine says it receives down to 50 mHz, but it won't hear anything below 60 mHz. The sensitivity is OK down to about 120 mHz and is really poor below that. On UHF it is good up to about 480 mHz then drops off. The sensitivity gets better around 700 mHz and I suspect it would be OK at 800-900 mHz.

The PL decode function is good if you have any receive IM or spur problems. Of course that is only if the repeater you're listening to is transmitting PL. In my area, I constantly hear spurs from car radios (Local Oscillator X 4). I listen PL all the time on UHF. Almost all the UHF repeaters in the Chicago area are transmitting 114.8 PL.

From: macino@mail.fwi.com
Message-ID: <4qbpp2$ba0@news.fwi.com>
Source record: 199175

I have a brand new Antenna Mart 5 Band 2 element fiberglass for Sale.
The antenna is 'still in the box'. The antenna uses 1 piece reinforced
fiberglass spreaders. The boom mounts are heliarced industrial quality
units. The antenna has been stored indoors since I purchased it about
2 years ago. I haven't seen a recent ad from Antenna Mart and don't
know what their status is. All documention and parts are complete.

I'm asking $300. It's not UPS able, so I'd drive 150 miles to help in Delivery.
It is easily transported on a Blazer, Jeep Cherokee, type of vehicle. I
bought it in Dayton, and just never got around to putting it up.

4373. FT-50R soft voice problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-20 00:00:00 UTC
From: rosch@stow3.ogo.dec.com
Message-ID: <4qc0rb$2ge@mrnews.mro.dec.com>
Source record: 199177

I love my FT-50R. However I'm told I'm 'undermodulating'. Ok - I have a soft voice and I'm not going to scream (to me) into the rig. If I get any closer I'll RF my eyes.

There's probably a pot to adjust but I don't want to dig into the innards and void the warrenty.

Is there a 'secret code' through the keypad to increase the mike gain? Does the Adams-1C programming sw allow a method of increasing modulation? Or do I have to send it to Yaesu or bring it to a licensed repair facility in eastovershoe?

>up, I'll have to do some serious prospecting on a more suitable apartment.

As Carlton Sheets would say, "Why pay the other fellow's mortgage?"
Forget apartments, buy a house. It has tax advantages, it builds
equity, and if you work the deal right you can put cash in your pocket
at the closing. But most important from an amateur point of view, you
can put up good antennas.

If you're really slick, you'll buy an apartment building. Then you can
put up whatever antennas you want, and your other tenants pay the mortgage.
In fact, talk to the owner of your current apartment building. You might
not even have to move.

I don't own any SGC gear, but I know several people who do, though
they mainly use them for non-ham stuff. They're good for sideband,
but stink for CW. I've heard one report from a fellow who seems to
have had problems with his, but all other reports I've heard are good,
so perhaps they have a quality control problem. One fellow I know
who has an SGC-2000 is the chief of telecommunications for FEMA, so
he really knows his stuff about reliability, etc. and that's the
rig he chose for his home, bought with his own money.

Hope this helped.

I will be blasted by many, but I have not even looked at this group in a long, long time, but your post did make me want to respond. You should have given them a computer and they would have tore your arm off taking it. They know what it take to live now, and ham radio dose not provide it.
Jim, WA7NDD.

Yes you are correct the very same student who had no use for ham radio would kill for a computer.

The hams here think they really have something in this hobby.
But real people with a life and a thirst for knowledge know better.

I have dropped the price to $300.00 plus shipping. After thinking
about it (and receiving a few letters) I figured that this would be a
better deal for somone. I will not go lower. Thanks... Danny.

Remove the keypad and battery. Take out the four black screws and the
two bottom silver screws holding the front and rear halves together.
Separate the two halves and locate the small ribbon cable connecting the
two halves. On the front half of the radio where the ribbon cable
attaches, locate a small black rectangular diode (D-215 I was told).
Use a soldering iron to lift the upper (towards the antenna) leg.
Reassemble the two halves and operate (legally of course).

I am not any kind of an expert in radio repair. This modification was
copied by me from a friends radio (that had been performed by someone
extremely knowlegeable) on my radio and has been working flawlessly.
73's to you all. Danny.

Hi everybody,

First of all thank you for taking time to read my message. My name is Jason and I live on the Island of Malta, in the middle of the Mediterranian Sea. I would be looking for a Meduim or Heavy Duty Rotator, to use with my VHF antennas. I shall be putting up 2 Cushcraft 18 Element Yagis (2M) stacked on top of each other as well as a 4 element beam for 6M and finally a 23 element for 70cm.

I also would like to hear from anybody who has any linears or preamps for the above bands.

Whilst hoping to hear from you soon, I thank you in advance.

73's for now

>I have recently purchased a STANDARD 5718 dual-bander and am searching
>for the MARS... modifications. I would appreciate any help.

1. Remove 4 screws and lift the top cover. (the top cover is the one
with the "TWIN BANDER" imprint.)

2. With the heatsink facing you, locate the vertical circuit board at the
front of the C5718DA

3. Locate the row of three blue chip resistors at the lower right corner of
the vertical circuit board, to the right of the connector labelled "CTD".
Remove the blue chip resistor that is closest to the main circuit board.

4. Replace the cover, and preform the ALL RESET procedure described in the
owners manual. The C5718DA is now configured for wide transmit.

Be nice,
Sean

4402. FT-50r Antenna Upgrade?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-20 00:00:00 UTC
From: FBUL85A@prodigy.com
Message-ID: <4qagkp$q48@usenetw1.news.prodigy.com>
Source record: 199253

Does anyone have an experience using the FT-50 with an SMA ducky other than the stock Yaesu? I saw a post a few weeks back about an ICOM that was "half the size" that was somehow "better" but there was no explanation given as to why it would be any more effective...

So, can anyone tell me if any other SMA ducky can add to the performance of the rig? HRO suggested the new Comet SMA-3 ($40!!) at 10 inches. Then they added the disclaimer that it might not be any better than the stock antenna!?!?

Also, I think I have figured out a way to swap the normal bandplan back after the 800 restore is done. I'm not certain why anyone would want to do this, except for warranty service... Drop me a line and I'll fill you in. Note that you need the ADMS-1C to do this...

Cheers!
Rob

Yes, I've gotten a tremendous amount of e-mail (30!) on this and all agree
that 100 watts is sufficient. All replies have focused on my antenna ...
or lack of an adequate antenna.

Thanks to all who replied! Its good to know that is hope at 100 watts.

I'll have to work in this, as it is quit hard being on the first floor
and surrounded by neighbors on all sides and above. When my lease is
up, I'll have to do some serious prospecting on a more suitable apartment.

save the current radio config as euro.rdf
then reload it
800 megs is blocked again and the full US amateur bands
are restored.
If you are ingenious you can remove the solder bridge behind
the key pad (left hand most and only solder bridge on the board)
and it will open up the full xmit. Then restore the wideband euro
settings and cellular coverage is restored....

Do you Americans know that you can get full cell coverage scanners from Canada. Last week I went to my local store (Durham Radio) and they have all kinds of goodies.

They still have the Radio Shack PRO-43's, as well as current models of AOR and Yupiteru (I think that's the way they spell it). All with full cell coverage. The salesman said that they sell into the USA all the time.

They've got a cool looking web site too. Their scanner page is http://www.durhamradio.ca/scanners.htm

I found them when looking for Ramsey kits. I run a pirate radio page and have a lot of people asking about the Ramsey transmitters.

If you are interested in pirate radio please visit my page at http://206.130.20.1:80/~glen/

Using a TS520S HF rig on 10 meters (about 50W as measured by a Heathkit power meter) I made contacts from New Jersey to places like Estonia, ex-Yugoslavia, France, Vennesulvia(sp!), and such. A few years ago when the sunspots were good. The above distances are about 1/6 of the Earth's circumfrence.

Used a vertical planted in the back yard.

4410. FT736R Mystery Choke

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-20 00:00:00 UTC
From: Guy Fletcher <guy@mpce.mq.edu.au>
Message-ID: <31C9D468.34A1@mpce.mq.edu.au>
Source record: 199261

Under the top cover of the FT736R, in the back left-hand corner, just to the right of and below a fuse board, is a brown toroidal AF choke with one end wired to a stand-off tag. It is wired directly in series with the main DC line to the 144MHz and 432MHz PA units, and probably also in series with the 2 optional PA units. It is similar, possibly identical, to the choke L801 in the REG Unit (see Connection Diagram, bottom left corner), but it is NOT this choke.

The inclusion of an undecoupled AF choke in series with the main power lead to a linear amplifier is a VERY STRANGE practice, even unprecedented. Why is it there?

Naturally it has no effect in FM mode, but its effect is dramatic on SSB. A voltmeter on the downstream side of this choke shows little effect, but a CRO shows that the DC line varies by about +/- 4 volts with each audio cycle. This dramatically lowers the PA gain.

If you decouple the choke properly, the gain rises so much that the MIC gain must be turned right down, making the speech processor inoperative!

This mystery choke does NOT appear on the circuit diagram or parts list. Did Yaesu fit it to mask some other instability problem? It has all the appearances of a last-minute factory cludge, rather than addressing the original problem it masks.

Any contributions from other owners would be welcome.

Guy VK2BBF guy@mpce.mq.edu.au

>Surely this would increase activity on the most under used UK amateur
>band ever!

>What say you Chris??

The mod will undoudtedly be placed onto the Internet in due course by the HRT Editor, in the same way as my earlier ex-PMR conversions articles on the MX294 and MX296 (plus a lot more, including complete earlier issues of the magazine) are on the Internet on the HRT Web site, for all to freely read and hopefully enjoy.

But this will be some time (typically at least 12 months) after being published in the mag. This is because we live in a real world where a publishing organisation (such as Nexus who produce Ham Radio Today) usually have to pay people, (including Simon, who's written and has had published some fine articles in the mag) for the articles which they themselves spend time and money in preparing.

Thus, it's not a case of doing the 'decent;' thing, as many people, including my wife and I, need to do work like this to allow them to eat, be clothed and sheltered, and to provide the same for their dependant family. But if such work benefits amateur radio, through the outlet of the magazine and the associated Web site, then it's even better as far as I'm concerned, it all helps the hobby.

To get the DJ-F1T into AM receive mode, go to VFO mode and press the
"B" key on the keypad. You can then enter an air band frequency, set
up scanning, store memories, etc. If you store an air band freq in a
memory, the set will automatically switch modes as you scroll through
the memories. To return to FM receive mode, press "B" again. There
is no capability to transmit on the air band in either mode.

>helps on getting involved in packet radio would be welcome.
>Thanks.

I have both a KPC3 and a Baycom unit (built from a kit). The baycom
requires a computer to be on to function and the KPC3 can work without a
terminal or computer until the buffer fills up. My quick point is that you
will be happy with a variety of products if I does what you want it to do.
That statement out of the way, I've been happy with both, but MY
recommendation to you is to borrow a TNC from a ham friend and try out a
couple for a month (need a bit of time to evaluate the unit and software).
Just realize that you will be evaluating both the hardware and software (ie
the PAKTERM software that comes with the KPC3 is awful, but there is great
shareware for it that inexpensively makes operation a joy).

Good luck

4426. Help! Hallicrafters S-200

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-21 00:00:00 UTC
From: gbelton@mailhost.tcs.tulane.edu
Message-ID: <DtCxxr.A2w@online.tmx.com.au>
Source record: 198927
Cross-posted to: rec.radio.amateur.equipment,rec.radio.shortwave

I recently found a Hallicrafters S-200 receiver at the Salvation Army store, priced at $12.50 so naturally I bought it. It's an AM-only receiver for the shortwave broadcasting bands. It uses 4 tubes and appears to have been manufactured in the 1960's.

It has two minor problems:

1 - a fairly loud hum that does not respond to the volume control. I could live with this, but I suspect it may be related to problem 2.

2 - a very harsh, raspy quality to the audio. It sounds sort of like what you hear when a SSB receiver is set just a bit off frequency, or like very rapid picket-fencing on FM.

If anyone has a schematic for this radio, I will gladly pay copying and postage costs. Any advice on what may be causing the above problems would be greatly appreciated.

4427. FS: IC-2GXAT Icom 2m *BRAND NEW IN BOX*

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-21 00:00:00 UTC
From: jeff@lek2000.com
Message-ID: <4qerjo$r7a@news.multiverse.com>
Source record: 198928
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap,rec.radio.misc,cle.forsale,misc.forsale,oh.forsale

I have for sale the following HT:

Icom IC-2GXAT 2 Meter

To see this radio, check out the web site at:

http://www.icomamerica.com/amateur/2mhh/#IC-2GXAT

IC-2GXAT

Dimensions: 2.2 (W), 4.9 (H), 1.4 (D), 12.9 oz
2 M
7 W @ 13.5 V DC
40 Memory Channels
700 mAh Battery
Auto Repeater Operation
Tone Scan
DTMF Redial, Memories
350 mW Audio
Selectable DTMFSpeed
Built-in PL Encode/Decode
35 mA Current Drain

Basically this radio is brand new, and comes with everything the stock version does. It is literatly in the box, and has been used for about twenty minutes due to curiosity. Its a very nice radio, especially in audio quality.

Reason(s) for selling:

- I won the radio at a local Hamfest less then a week ago.
- I already own a HT which I'm happy with.
- I would be unlikely to use this radio to its full potential.
- I would rather use the $$ generated from this radio to purchase a Kenwood or Standard tri-band mobile.

Asking price:

I'd like $225, plus shipping, handling, and any desired insurance methods. If this is beyond your budget, yet you would like to purchase the radio anyway, please feel free to make an offer. Any $$ raised from the sale of this radio is going to be used towards the purchase of my new mobile (which i'm already paying for anyway).

To contact me:
Send email to jeff@lek.net of feel free to call my voice mail @ 216-552-4368

>73, Jim KH2D

This does seem to be one of the major problems of the amateur radio service today, too many people can't tell the difference between it and stamp collecting or bird watching or water sking. To these benighted souls, it is "just a hobby", of no value to their nation or themselves beyond a simple passtime.

Source record: 198935

(Continued from previous message)

This is the first time in memory that another service has been proposed for the two-meter amateur band. We must make sure it is also the last time.

We do not need to explain to ARRL members the extensive use that is made of these bands by amateurs. The two bands provide the backbone of our local public service communications effort. Voice and data, mobile and fixed, even television--the list of present amateur uses is a long one, and of future uses is even longer. Both are already used for satellite services and for moonbounce and extended-range terrestrial operations requiring extremely sensitive receivers and high levels of effective radiated power.

Apparently we did need to explain all this to the little LEO industry representatives, so we did just that--both at the meeting and in a followup letter on May 15. We also explained that we had to regard the matter as extremely serious. No one with the slightest background in radiocommunication could possibly believe that a mobile-satellite service could be introduced into either band without disrupting existing and future amateur operations. Therefore, we said, if we did not receive assurance that they would be taken off the list of candidate bands by the deadline for this issue of QST, we would have no choice but to bring the matter to the attention of the entire membership.

The response we received was unsatisfactory. In effect, we were told the little LEO industry would consider our views but that until their spectrum needs are satisfied, all bands must remain under consideration.

So, this is a call to action. We must get across to the industry and government participants in IWG-2A that the 144-148 MHz and 420-450 MHz bands cannot be considered as candidates for mobile-satellite services. We need to drive the point home so forcefully, with so many grassroots responses, that no one is ever tempted to try this again.

Which brings us back to that invitation for "interested parties" to send input "at any time." There's no time like the present! According to the Commission's new procedures, comments by e-mail should be sent to: wrc97@fcc.gov. Written comments, with an original plus one copy, should be sent to: Office of the Secretary, Federal Communications Commission, Washington, D.C. 20554. Each comment should include at the top, "Reference No. ISP-96-005" and "Advisory Committee Informal Working Group 2A." FCC staff assures us that comments will be given prompt consideration, and asks that parties refrain from filing comments in accordance with previous instructions.

Do comment. But be civil. Don't abuse people who are simply doing their jobs. We have to get across that casting covetous eyes on amateur bands is counterproductive, and contrary to the public interest. To accomplish this we need a lot of comments, including yours. But remember that the objective is to educate and persuade, not to intimidate. We don't need to. The facts are on our side.

==========
FCC Public Notice:

Procedures for Submitting Comments to the WRC-97 Advisory Committee

June 6, 1996

On March 14, 1996, the Commission released Public Notice (No. 61997) (Streamlining Notice), that announced its new streamlined World Radiocommunication Conference (WRC) preparatory process.

Under this new process, formal Notice of Inquiry (NOI) proceedings are eliminated in favor of developing WRC proposals in the Commission's WRC-97 Advisory Committee. This removes the redundancy that was inherent in our previous "NOI-WRC Advisory Committee" process and enables the United States to respond more effectively to the rapidly evolving international environment and to the ITU's new two-year WRC schedule.

The Streamlining Notice included general guidelines for submission of public comments to the Advisory Committee. The Notice stated that procedures would be developed to ensure that members of the public continue to have full opportunity to participate in the development of WRC proposals under the new streamlined process, including those parties who do not attend meetings of the Advisory Committee and IWGs.

Since the release of the Streamlining Notice, we have gained experience with our new process. We now provide these procedures for submitting comments to the Advisory Committee.

Comments on Ongoing Advisory Committee Matters: Parties that wish to comment on the ongoing deliberations of the Advisory Committee and its IWGs may do so at any time.

Comments on Preliminary Proposals: As announced in the Streamlining Notice, preliminary WRC proposals developed by the Advisory Committee

(Continued from previous message)

will be released by the Commission in periodic Public Notices. These Public Notices will allow an opportunity for public comment and will provide the appropriate procedures, such as filing deadlines, to be followed.

In either case, parties wishing their comments to be considered directly by the appropriate Advisory Committee group and to become part of the Advisory Committee's public record should submit their comments in writing to Office of the Secretary, Federal Communications Commission, Washington, D.C. 20554, or by e-mail at wrc97@fcc.gov. Commenters are requested to file an original plus one copy.

The comment should reference the Advisory Committee public record file number, "Reference No. ISP-96-005" and the appropriate Advisory Committee Informal Working Group, if known, in which their submission should be considered. The FCC staff will ensure that comments filed are considered in the appropriate groups.

For the most expeditious and efficient consideration of their comments, parties should refrain from filing comments directly with the Chair of the WRC-97 Advisory Committee, with the Chairs and Vice-Chairs of the Informal Working Groups, with individual FCC staff members or private sector participants in the Advisory Committee process.

For additional information, contact Cecily C. Holiday, Federal Officer of the WRC-97 Advisory Committee, or Damon C. Ladson, Alternate Federal Officer at (202) 418-0749, or consult the WRC-97 Homepage on the Internet http://www.fcc.gov/ib/wrc97/.

Source record: 198940

OK folks, I'm very late on this, but when QST magazine came out with the notice that NTIA and the FCC were trying another highjacking of bandwidth, I went and got the info, then received permission to post it all over as far and wide as I could. So I am.

This is NOT just for the US, it also involves Canada because the Canadian government wants to do the same thing in concert with the U.S. So HEY CANADA - YOU ALL LISTENING UP THERE?

The FCC ripped of part of the 200mHz area from the amateur radio community and gave it to an overnight delivery service. They have YET to use that frequency area. Then congress thought it was just be a real neat idea to rip off the 800mHz cell phone area and were bought off by the mega-buck cell phone companies.

Well guys and gals, they were not through. Here is a reprint (with ARRL/QST permission) of the article.

Whether you like me or hate me is immaterial here. The facts are this affects us all equally. Amateurs, scanner nuts, shortwave, etc. This continued rip-off by the FCC (and Canada) will not end until no citizen has access to the bands.

Please, I urge you all to print this out, read it carefully, then do what ARRL requests. Then, if I may impose, please re-post the message below WITHOUT changes to everyone you happen to know who's an amateur or has 1 to ???? scanners they listen to.

Again, this affects us all, U.S. and Canada, too.

Roger Cravens
KE4YQZ

After I wrote to them, I also provided a copy of my correspondence to my Congressional representative and senator. It would probably be an excellent idea to do the same.

Reproduced and forwarded with the kind permission of ARRL/QST Magazine.

All of the volunteers and staff at given blanket permission to reproduce from the July, 1996, issue of QST.

Steve Mendelsohn, WA2DHF, 1st Vice President, ARRL

ARRL Web: Threat to 2 Meters, 70 Centimeters

Radio Amateurs Mobilize
Against Threat to 2 Meters, 70 Centimeters

Newington, June 6: Amateurs' comments are making an impact! FCC changes procedures to handle deluge. Committee chairman asks ARRL, "end this campaign." ARRL responds, "you have been misinformed," urges continued member participation.

In just one week, more than 1000 comments from amateurs opposing commercial exploitation of the 2m and 70 cm bands have been received at the FCC! In a June 5 letter to ARRL Executive Vice President David Sumner, K1ZZ, FCC's Cecily Holiday confirmed that "all written and electronic comments received at the Commission to date by Amateur Radio operators have been included as part of the public record on WRC-97 proceedings. However, in the interest of efficiency, we have created a designated FCC office and e-mail site to channel future WRC-97 comments directly to the WRC-97 Committee Chairs."

An FCC Public Notice dated June 6 outlines the new procedures.

Also on June 5, FCC Industry Advisory Committee Chairman Scott Blake Harris wrote to Sumner to object to the ARRL's "tactic" Sumner replied the same day, "As you have been misinformed with respect to the League's activities, I am pleased to have this opportunity to set the record straight." We have honored his specific request "that ARRL ask its members to stop the e-mail/fax deluge directed at private sector members." However, "we reserve the right to report in the future on the actions of any participant in the WRC-97 preparatory process. Furthermore, we will continue to urge our members to monitor the process closely, and to participate as required to protect the interests of the Amateur and Amateur-Satellite Services." The complete texts of both letters are available on this Web site.

The presses had not yet rolled out page 9 of July QST, so the editorial planned for that issue has been revised to reflect the new FCC procedures.

Check this (www.arrl.com) site often for further developments.

Newington, May 29: The American Radio Relay League is asking radio amateurs across the United States to help defeat a threat to the two most heavily used amateur VHF and UHF bands.

An industry working group (known as IWG-2A) that is preparing draft US proposals for the 1997 World Radiocommunication Conference has before it a list of "candidate bands" for low-earth orbit mobile satellites ("little LEOs") that includes, among a number of others suggested for consideration, the 144 and 420 MHz bands. Little LEOs are intended

(Continued from previous message)

mainly to offer commercial paging and other low-data-rate messaging services. The list of candidate bands was submitted by little LEO industry representatives at a meeting of IWG-2A on May 7. ARRL Technical Relations Manager Paul Rinaldo, W4RI, was present and objected strongly to the inclusion of these two bands. He was told that objections should be submitted in written comments, and the ARRL did so on May 15. At the same time the ARRL advised the industry participants in IWG-2A along with its chairman, Warren Richards of the Department of State, that if we did not receive assurance that the bands would be dropped from the list of candidate bands we would have no choice but to advise members in July QST that the bands were under threat. No such assurances were forthcoming. Instead, we were told that as long as little LEO allocations requirements remained unsatisfied, everything had to remain on the table.

This response was not acceptable. Accordingly, when July QST went to the printer on Tuesday, May 28, it included the following editorial. The editorial speaks for itself, but it is worth emphasizing that there is no reason for panic. What we are dealing with is an ill-considered industry effort that is in its early stages; there is no reason to believe there is any government support for any move against these two amateur bands. Our mission is to quash the idea before it goes any further. An outpouring of thoughtful comment by amateurs, explaining why the public interest would not be served by the introduction of commercial services into these bands, will go a long way toward ensuring the desired outcome.

The editorial can be reprinted in its entirety with the credit line, "Reprinted with permission from July 1996 QST." You can download and view this column as the Adobe Portable Document Format file "/files/qst/2m70cm.pdf" (20,418 bytes), also available via FTP at ftp://ftp.arrl.org/pub/qst/2m70cm.pdf. (You'll need Adobe Acrobat 2.1 or higher to view or print this file.)

==========

It Seems to Us, July 1996 QST (Revised):

Write Now!

Get out a pen and paper, or boot up your computer. There's work to be done! Your help is needed to defend two meters and 70 cm. Yes, that's right--the two most popular and most crowded amateur VHF/UHF bands! But don't panic, and don't "go ballistic."

Here's what's happening, and what you can do about it.

The United States is preparing for the 1997 ITU World Radiocommunication Conference, WRC-97. In the past, the public has been able to participate in the preparations for such conferences by responding to FCC Notices of Inquiry. In March, the FCC announced a streamlining of its International Bureau's preparatory processes for WRCs. Under the new scheme, the NOIs have been eliminated in favor of increased emphasis on WRC Advisory Committees.

For WRC-97, a series of Informal Working Groups (IWGs) of the Advisory Committee has been created to address specific agenda items. The output of each IWG will go directly to a joint FCC-NTIA-Department of State Steering Committee of the Advisory Committee. There, draft proposals as received from the IWGs will be reviewed and forwarded to the FCC for possible release as preliminary US proposals for public comment.

In announcing the streamlined WRC preparatory process, the FCC tried to reassure those who might be concerned about reduced opportunities for public participation: "Interested parties should note that input to the Advisory Committee may be sent at any time...."

A pre-press version of this editorial, circulated far and wide by e-mail and packet radio, caused so much input to be generated--more than 1,000 comments in less than a week--that the FCC had to modify its procedures to cope with the deluge!

Hold that thought while we shift gears to the substance of the issue.

One of the WRC-97 agenda items includes consideration of possible additional frequency allocations for the mobile-satellite service. So-called "little LEOs," low-earth orbit satellites below 1 GHz, already have allocations. Their proponents claim these are inadequate and are trying for more. The needs of little LEOs are being addressed in IWG-2A, chaired by Warren Richards of the Department of State. The ARRL technical relations staff participates in IWG-2A to represent Amateur Radio interests.

At the May 7 IWG-2A meeting, an industry representative presented a list of "candidate bands" for little LEOs. The list included a number of bands that would negatively impact existing services, and does not include others that would appear to be technically more feasible but to which strong objection from incumbents could be expected--the point being that some political, rather than purely technical, judgment already has influenced the list.

We have asked for, but to date have been given no explanation of why some bands were included and not others.

Incredibly, 144-148 and 420-450 MHz were included on the list!

4442. IC-706 Logbook/Cable Offer

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-21 00:00:00 UTC
From: dteague@csc.com
Message-ID: <4qfj94$9bo@explorer.csc.com>
Source record: 198943

Just thought I'd put in a nice word for Icom re their 706 registration gifts. Got the logbook today with a letter saying that the OPC-581 Separation Cable was back-ordered until September, and a SASE with a check box to request a MB62 Main Unit Mounting Bracket in its place or to continue to wait on the cable.

Since I had already purchased the Cable on my own and didn't have the bracket, I really appreciated this option.

Thanks Icom for 'making it right' after the delay.

I have had a tech license for a number of years and was active on 2 meters. I have not done much recently because of some physical problems-- I am now disabled.

I have almost new Kenwood TS-820. I live in a house with an attic. I cannot erect an outdoor antenna because of restrictions in the cluster housing development in which I live.

Would like sugesstions on:

What do I need in addition to my TS-82o in order to get going ?

What type of antenna would be the best?

I assume I will need an antenna tuner. Any suggestions ?

What else would I need ? Since I have difficulty in doing anything physical, I would like as much trouble-fre, low (preferably zero) effort stuff as possible.

I would like to do some DX voice.

I do plan to beef up my code for general class,

Many thanks for any opinion.

gordon.coplein@swsbbs.com

4449. Help: Desk Mic with IC-706

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-21 00:00:00 UTC
From: Joe Fitter BV/N0IAT <FITR%mimi@magic.itg.ti.com>
Message-ID: <31CB22E9.344E@transend.com.tw>
Source record: 198950

Well...after trying unsuccessfully for several weeks to "adjust"
the audio of the IC-706 with a combination of MIC GAIN, CARRIER
SHIFT, and COMPRESSION LEVELS, I've decided the root of the problem
must relside in the cheap condenser microphone that
Icom is using with this radio. All reports indicate very high
pitched audio, difficult copy, etc. Unlike some early reports, I get
plenty of ALC action -- but the audio is kinda crappy and listeners
report a wide, mushy signal that lacks base response.

I bought a small ether-net 8-pin modular plug with a pigtail
coming from the connector. I plan to wire up a nice Yaesu
MD-1 to it and see if things improve. But first, some
questions:

1. On my old IC-751A, I could not use any microphone unless the mic
had some audio preamplification circuitry inside. Is this true
of the 706 as well? I built a preamp box to use with a Shure 444D
and it worked ok.

2. When using my Heil on the old IC-751A, I had to build a preamp
circuit to get the Heil to adequately drive the Icom. Is the
same true when running the 706?

3. Anyone tried some name-brand mic's with the ICOM 706 other than the
HM-103 stock microphone and have "dramatically improved" audio
reports? What mic did you use and did it have an internal preamp?

4. Where do you, IC-706 owners, run your mic gain, compression level,
and carrier-shift? What settings ? I usually keep mic gain at
6 or 7 (depends on HF band), Compression at 12:00, and carrier
shift at -100.

5. Why did I EVER sell that 751A? This sardine can is NOT up to
the Icom performance that I am used to.

At this point, my IC-706 is just marginal on cw (qsk stinks and
occasional audio popping when switching to tx) and I am about
to lose faith entirely if I cant improve the tx audio on SSB.

I appreciate any tips or suggestions.

Joe

Message-ID: <4qemfr$s84@galaxy.cybergate.net>
Source record: 198953

I recently aquired two Mitrek L43JJB1190CM Base Station Radios. I called Motorola for the part numbers of the manuals, but before I spend $80 I thought I would ask if these radios were able to be retuned to the 2-Meter Amatuer Band in a practical manner before I sink $80 into manuals. Has anyone done this, and if so, would you please share your experience? Thanks.

These radios are currently tuned to the 164.125 to 164.275 MHz range, and were "detuned" down to 25 watts at the initial installation since they were used adjacent to a airport. Otherwise they are in excellent shape.

Thanks for any help you may render.

I have been using an SGC SG230 automatic tuner for approximately 3 to 4 years. It is an excellent product. I had one minor problem about a year ago and shipped the tuner to SGC for repair. It was repaired and returned via FEDEX, no charge for repairs or shipping. I had it back on the 7the day after I shipped it. Quick turn-around! A friend has an SG2000 rig and he has been pleased with it although it does not have all the bells and whistles of most amatuer equipment. Their equipment is primarily commercial grade. It is a good company form what I have seen.

I get the biggest kick out of chatting with "space people," have several MIR and one SAREX voice contact, this is almost too fun to be legal! Anyway, I usually go to a nearby hill-top to do my "fishing" and got tired of lugging all the radio stuff, so I built a nifty "ham-shack-in-a-box".. Not terribly unusual, but it was a ball to build. If you have a web browser that does graphics, I invite you to check it out and send me any comments or questions.. You'll find it at:

http://www.cyberhighway.net/~rb/project.html

A note to all of you who frequent this group but don't have a Amateur Radio License, GET ON THE BALL! It's never been easier to get a HAM license, you do NOT need to learn code to use the frequencies that are used by MIR and the Shuttle (SAREX)! A friend of mine, with NO previous radio/electronic knowledge borrowed my study book on Wednesday evening, took his test on Saturday morning and passed with a 98%! You can do it too! Amateur Radio NEEDS new blood, if we don't use these frequencies, we'll loose 'em to big corporations and the government, thats a fact! If you have any questions about becomming a "HAM," please ask me! I'll trip over my big feet to get you the information you seek! The first time you call for an astronaut, beit on the MIR or the Shuttle, and a voice comes back to you saying your call sign and a friendly greeting, it will all be worth it! Trust me, it's litterally the most fun you can have with your clothes on.. hehe

Take Care and 73's

Just be sure you are aware of the price of replacement tubes. They are very expensive. I wouldn't doubt if that is the reason TT quit making the amp.

I've used their SG-230 SmartTuner and it works well. It's rated at
150 watts and I plan to upgrade to the new SG-250 500 watt model
some time after it is more mature. I prefer to live on the blunt
edge and not the bleeding edge of technology.

The SG-2000 HF transceiver is interesting as a solution for mounting
all of the operator and connectors really remote from the RF deck.
The standard ham solutions (IC-706/TS50S/DX-60) are intended to mount
only 10 to 20 feet away, say cockpit to trunk of a vehicle, and then
you most likely end up with no morse key jack or all of the controls
you want to twiddle at the remote head. The the SGC rig does it
right and also with far greater separation. At this point the rig's
100Hz tuning steps make it unsuitable for my needs, but the company
says that they are thinking about bringing out an amateur radio
version with perhaps 1Hz tuning steps.

At that point the SGC transceiver with their 500 watt amplifier and
the newer tuner will make a dynamite (and pricey) solution to my wish
of putting a very small full-functioning rig in the house with all of
the bigger bits way out of site and in the shack nearer to the mast.

Hi, all !

I would like to know internal scheme of ICOM's remote control microphone HM-75. I have some idea how this microphone works, but I am not sure. I think that remote functions are connected to middle pin of 3.5" speaker jack over different values of resistors (same as in Kenwood remote microphones).

ANY IDEAS ?

PLEASE E-MAIL ME TO: berucha@k332.feld.cvut.cz

I have one Yaesu 5100 dual band xcvr (2m/70cm). It is in outstanding condition. I have only turned on may be two or three times in the last year. The unit will come in the original shipping carton, manual and all other accessories.

The unit is about two years old. AES is selling it for $659. I will sell it for $450 +SH or OBO.

Reason For Selling:
Getting out of ham radio completely.

Terms:

You will have one week after the receipt to try out the unit and make sure that every thing is functioning as desired. If you find something wrong with it or feel that I have misrepresented in any way the condition or working of the unit, just let me know and I will return back your money.

If interested please e-mail me or call me at

Work: 1-412-338-6934 8am to 5pm EST
Home: 1-412-653-0534 7pm to 9pm EST.

Thank you for your interest.

From: cfb@bga.com
Message-ID: <4qfpn0$d8c@news3.realtime.net>
Source record: 198957

I originally meant to post this (slightly edited) article below to rec.radio.amateur.homebrew, rec.antiques.radio+phono and here. I goofed on the here part, so I am posting it separately. I must pay attention, I must pay attention, I must .....

I have a 50W CW TX design based on the 6LR8 TV sweep tube. This is a combination triode oscillator and tetrode amplifier. The oscillator plate output is fed to the tetrode control grid via a capacitor.

The Morse is transmitted by having the Morse key in series with the cathode-ground circuit of the tetrode (with a low value capacitor across the key in order to declick it). The anode goes to B+ via a choke with the RF going also from the anode to a pi filter/resonator (and thence to the antenna). The advantage of this keying approach is that the triode oscillator is left running without interference and thus is quite stable.

I am not sure of the impedance of the tetrode under open key conditions, but I bet you'll get a really good kick if your finger finds its way between the open Morse key contacts (the B+ is between 200V and 400V).

I have never looked at a Morse key closely before. Are they designed to keep the HT safely away from the user, or is this an accident waiting to happen? BTW, the circuit will be isolated from the mains with a transformer (see below), so there's no chance of the user grounding the HT. Thus, it will be fine if the key body is at the chassis's ground potential.

Regarding the transformer - I need one with a primary of 110V and either a 300V CT to 400V CT secondary OR a 150V to 200V secondary without CT. It must be able to deliver 200mA. A separate 6.3V CT > 1A winding will be nice, but not essential.

I have looked in the Antique Electronic Supply catalog (very expensive) and Fair Radio sales catalog (they don't have quite what I need). In addition, I have looked in All Electronics, MECI, JDR, Parts Express and Digikey catalogs. They don't have transformers with this kind of rating. Does anyone here know where I might find such a device, but less than the $50 or so AES is asking?

Finally, to the tube socket - the 6LR8 is a 9 pin Novar based tube. I have looked for a matching 9 pin Novar socket in the catalogs listed above, but to no avail. Does anyone know where I might find one of these?

Cheers,

Chris (cfb@bga.com)

Kenwood and Microsoft agree ham radio is dying.
(but I told you that a long time ago)

KENWOOD DEFENDS DISTRIBUTION PLANS

Kenwood Communications Corp says its recently announced plans to make its products available in more retail outlets will help to rejuvenate ham radio. Citing concerns about the future of Amateur Radio and a changing business climate, Kenwood announced it was taking "some bold steps" to revamp its wholesale distribution scheme.

In a June 10 open letter to the Amateur Radio community, Kenwood's Amateur Radio Products Group National Sales Manager Paul Middleton, KD6NUH, painted a dismal picture. "When we looked at where Amateur Radio is today, and where it is going to be in ten years at the present rate of decline, the future looks bleak," he wrote, citing competition from unlicensed communications modes. (internet).

"It is also obvious that the rate of no-code licensees is slowing down with fewer and fewer people upgrading," Middleton wrote. "Amateur Radio dealers should be more interested in attracting new people to our hobby. Every current amateur operator who wants this hobby to continue should be promoting ham radio to non-hams."

* Microsoft Network (MSN) has dropped its Amateur Radio Forum, reports the unofficial forum manager Rick McMillion, WB7UGZ. He said MSN gave him the word recently in a terse e-mail message. McMillion says he had no warning that MSN was going to dump the forum.

>have seen the project in the 1994 ARRL Handbook, and think it might be a
>little too complicated to start with. Any help along these lines will
>be GREATLY appreciated.

The "standard" way to start out on 10 GHz has been with a pair of Gunnplexers. The cheap motion detector types (about $20) will work, though the Microwave Associates units are better. Advanced Receiver Research sells complete MA units, though they're a bit expensive (over $300 each). The major difference between the MA type and the motion detectors is that the former have a separate modulator varactor diode while the latter have to be modulated by varying the Gunn diode current. This allows the MA types to handle wider bandwidth modulations, such as video or high bandwidth data, while restricting the motion detector types to just voice or lower bandwidth data.

Due to the relatively poor frequency stability of Gunnplexers, WBFM with AFC is used. They are always setup in duplex links by offsetting one of the pair by the IF frequency from the other. Typically, 30 MHz has been chosen as the IF, so the two Gunnplexers will be offset 30 MHz from each other. However, the 10 GHz amateur band is wide (500 MHz), so a higher IF can be used. One cheap solution is to choose 100 MHz (or any other clear frequency in the FM broadcast band) as the IF and use a regular broadcast FM receiver as the IF.

One of the pair is allowed to free run while the other has the AFC voltage of the IF receiver brought out to drive its Gunnplexer. This forces the "slave" station to track the other station at the fixed IF offset. As I mentioned, operation is duplex. The Gunn source acts as both transmitter and LO for the station at the same time. This means you hear yourself as well as the other station in the IF receiver.

For modulation of the motion detector types, use an adjustable current regulator with the modulation superimposed on the adjustment terminal of the device. There are several 3-terminal regulators which can be used this way. For the MA types, just apply the modulation to the varactor diode. The hardest part of this project is combining the AFC voltage from the IF receiver of the slave station with the

modulation of the slave, and with a DC tuning voltage. An opamp summer works fine for this.

You do rough tuning of the units with their mechanical tuning screws, do fine tuning with the DC tuning voltage, then flip a switch to activate the AFC voltage on the slave when you hear the other station. That's it. The units should stay locked together from this point on and you should be able to work duplex. A more elegant method sweeps the DC tuning voltage until lock is achieved then transfers control of frequency automatically to the AFC.

Note, you need some way of measuring the 10 GHz frequency so that you stay inside the amateur band. A simple wavemeter is sufficient. You can make this (adapt a micrometer as the tuning plunger and scale), or scrounge one surplus, or borrow one from another amateur active on 10 GHz.

The switch activates according to the position of the roller. The series resonance only moves below 30 MHz when the roller is almost all the way at minimum L.

>Would a "complete" path around the case be able to constitue a
>"shorted turn" around the internal roller inductor. This is the
>only possible reason of which I might concieve.

No, not at all. Look at the mounting brackets, they are large "shorted turns" right at the very ends of the coil in the flux path. I'd worry about using non-conductive ends long before woryying about the case.

Besides that, the shorted turn effect deals with a small area of metal, a screwdriver blade is large enough to create a problem. To eliminate the shorted turn effect, the conductive material must be VERY small as the coil flux sees it. Grounded or not, the cabinet would have EXACTY the same effect.

The only thing insulating the case does is RUIN RF shielding.

>Well, Tom, this morning I downloaded Paul's patent; he has the

>means that low vswr values can be obtained with the three
>variable element tuner, but that these values might not actually
>be a "conjugate match", and therefore the deleterious conditions
>listed would occur.

That's technical gobbly gook. The hype about matching without it being a conjugate match is rubbish. Here's the way it works.....

A T or pi net work has variable Q, determined by the ratios of the reactances to the resistances in the system. The Q can be set to any value desired with a T or Pi netork. An L always operates with the lowest possible Q when matching two impedances.

As a general rule there is no combination that results in a low SWR without power transfer occuring. The only exception is if an unwanted series resonance in a very lossy component occurs, and then all the transmitters power would be dissipated in that component. But that also requires the component have very low Q, it has to have a real resistive part of the impedance that dissipates power.

We all agree minimum loss occurs with minimum operating (loaded) Q. The efficiency does decrease as loaded Q increases. If you simply use the maximum capacitance that permits a match in a high pass T, or the minimum in a low pass pi, efficiency will be maximum. If you use other settings, efficiency and power handling will slowly decrease as Q is increased. There are no settings that magically stop the system from working, or "false matches" (with the exception of the series resonance...like the one you ran into in your Xmatch even though it claims it eliminates the problem).

The use of fixed caps in the T results in minimum Q and maximum efficiency only when the capacitive reactance of the fixed caps is zero ohms. In that case, it would become an L network, and have all the features claimed, as do ALL L networks.

The exception is the conjugate match hyperbole. It's folklore.

If the series fixed C has any appreciable reactance, here's what happens. As frequency decreases, minimum Q increases. Efficiency and power handling decrease on 160 (just as it does in a conventional T). Either the fixed capacitor is so large the circuit simply behaves as an L, or the thing suffers the same maladies as any other T network.

It certainly is NOT an optimized T circuit on any one band, let alone several. Even if only load Z changes, the fixed cap needs to be changed for maximum efficiency.

Come on, Gary. How many lives have you saved lately ? I'm not your
Congressman, nor do I work for the FCC. You don't have to use the
'service' line on me. The closest ham radio comes to being a service
is that it is self-serving. Some benighted souls get so engrossed in
thier hobbies that they confuse them with services or professsions.
Anybody who wants to save lives should join the volunteer fire
department and skip ham radio.

>antennas?

Hi Charles,

Consider yourself very lucky to live in the 'good ole US of A'. The powerlimit is 1.5 Kw if I'm not mistaken. Here in Belgium we have 150 Watts maximum power. I've been on HF since september 1994 so that means most of my operating is done with very little sunspots. I don't use my HF radio a lot but so far I've worked around 120 countries on 20 meter and up. I don't have antennas for 30,40, 80, 160 meter. On the other bands I use a Mosley TA-53M at 12 meter (36ft) AGL. I'm also using a TS-450SAT and output is typical 80-100 W. Besides this I made my first QSO on HF with a OD5 station when had a mismatched sloping dipole (pointing north) at 1 meter above the ground at the

lowest point and 10 meter at the highest.

I suggest to LISTEN on the bands and if you hear a strong signal you WILL work them. Did you know that people run QRP (less than 5 Watts) and work the world? Maybe you could try to put a vertical multiband on top of the apartment building? It may also be posible to run a wire to a tree or something and tuning it for minimum SWR. Best is to get the antenna OUTSIDE.
You can always make up the difference in signal strength with operating practice.

Listen on 14.306 (+- QRM) in 3 weeks time... you might work W6/ON4BAM/m or W7/ON4BAM/m.....

Nevertheless... have FUN on HF. That's what's important.

Just my 2 cents, Your mileage may vary
Opinions are my own (most of the time).

To measure the 10 GHz frequency, Set up the Gunnplexer to transmit
and measure the receive diode current. Put a sheet metal reflector
in front and move it towards and away from the Gunnplexer. You
should see the diode current go through minimum and maximum values.
The distance between minimum's is a half wave. If you move
the plate through many halfwaves you can average the measurements
and easily get into the 10GHz band.

I hope that description is clear.

Sean,

I have purchased at least two chargers and a dozen battery packs from
W&W over the last five years and have been extremely pleased. My Icom
IC-T7A is charging on a MasterCharger I at the moment right in front
of me. W&W frequents many hamfests in our area and definitely stands
behind its products. Happy hamming!

Bob,

I can't think of a more difficult amp to convert.

572's and 811's barely work at 30 MHz, the long thin grid leads inside the tube envelope are the primary problem. Since the problem is inside the tube, there is little that can be done to fix it.

4500. FT-50 charging question?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-22 00:00:00 UTC
From: stevehan@yrkpa.kias.com
Message-ID: <4qhvov$a7r@yrkpa.kias.com>
Source record: 199089

I just purchased the Ft-50 5 watt verison which came with the 15 hour charger. Is the battery suppose to have a charging jack? The only jack is the DC jack on the side of the radio. If that is the charging jack how do you use it on DC or in the car without it effecting the charging rate. The adapter is 15v 200ma. If I use it in the car or another power source the charging rate will be different which would be hard on the battery. Just got the radio to day and stores are close til Monday. Would like to try to charge it up overnight.

Lots deleted. This is a good dose of reality here. Thanks, Tom.
A bit off the topic, but a Patent may be worthless even if granted.
The Patent examiners are not experts and cannot test their validity.
This Patent may be quite vulnerable to legal attack ... but it is
unlikely to be tested since I supect the X match folks will not sue
MFJ for putting a bypass switch or grounding switch into their
tuners for patent infringement.

I just bought one, it's great but I'd like to wideband it.
Anyone know which wires to cut/diodes to remove? Thanks!

Help! I have a friend of mine who just purchased an Alinco DR-605T
and we are looking for any mods or keyboard modifications that can be done
to this radio. This is a realitively new radio. I think they said it just
got the FCC type acceptance about 2-3 weeks ago. Any help would be appreciated.

Recommend you buy a Yaesu FT50R service manual. It costs about $25.

From the service manual, here is the rear view of an FT50R
with the battery removed:

```
+-------------------------------------------+
| VR1001 VR1002 TC1001
|
| o o o
|
|
|
| O O O
|
| GND CHG +12VDC
|
|
+-------------------------------------------+
```

Notes:

VR1001 = VHF deviation adjust potentiometer
VR1002 = UHF deviation adjust potentiometer
TC1001 = PLL reference adjust trimmer

This could actually be good news for the community. Infusion of the Internet into our society may eliminate those who viewed amatuer radio as another form of CB. Once that crowd leaves the airways amatuer radio may return to the civil, and critical, service it was intended to be.

First thing I would do is to replace the filter capacitors in the power supply. They are usually easy to spot and are ususally in the 40uF at 350 volt range. I'm not familiar with your particular receiver, but I would imagine that the filter caps are probably housed in a cylinder mounter on top of the chassis (similar to the way tubes would be mounted). Replacing these caps will usually eliminate both problems.

In addition to replacing the filters, also invest in the time required to replace the B+ bypass capacitors. These guys are usually in the neighborhood of 0.1uF and are used to bypass the AC component (hum) in the plate and screen grid supplies. Look for them around each tube's plate and screen grid circuit.

Performing these simple mods should return your receiver to hum free operation.

There are supposedly 2 mods for the Z1A. The first one adds RX
118-136 AM AIR, RX & TX 136-174, 400-479 MHz.

The other one adds RX 800-999 MHz. One of the mods requires adding a
surface-mount transistor. I had them both done together in Dayton for
$50. Of course, it only took the guy 20 minutes to do it.

Good Luck. Mark

I messed up somehow, I think.

My new 160 meter full wave horizontal loop performed beautifully (I recommend the design highly.. quiet and powerful). However, it stopped working after I put the discharge device (lightning preventor) in line and tarred the feed point. I replaced the discharge device with a pig tail and the antenna still checks bad.

Is plastic roof cement an RF conductor?

That's scare tactics and Marketing strategy. Kenwood and other
manufacturers are pressing for No-code licences. I bet that Kenwood's
Sales Manager Paul Middleton KD6NUH, is a no-code advocate.

About Microsoft, so what. They dumped their ham radio forum from
I don't know where, who cares. We got plenty of sites on the WEB
and Compuserve.

About Kenwood, I use a Kenwood HF RIG but next rig will be
YEASU or TEN-TEC. Vote with your wallet !

Since the (U.S.) power limitation on 30 Meters is low, most amplifiers do not cover this band.

20 Meter coverage is generally wide enough to work on 17 Meters.

15 Meter coverage is generally wide enough to work on 12 Meters.

If your amplifier was originally made for the U.S. market, it will not have 10 Meter coverage, but can be easily modified for operation on that band ... a photocopy of your Amateur License, sent directly to the manufacturer, will bring you the modification information.

The above applies to almost any amplifier.

Good luck!

Source record: 198980

Robert,

Great stuff! Two meters will open a whole new world of communications for you! Scan the band and soon you will find a frequency/repeater that appeals to your own likes and needs. For not-too-much money, you can have a outstanding station with loads of modern features. Most repeater and simplex groups will welcome you warmly.

Repeaters link states, counties, cities and more. The rule of thumb is, what you can see, you can talk to. Repeaters are installed (almost always) at some vantage point. Mountain tops are the first choice. Communications towers (TV, radio, etc.) are other good choices. Water towers work fine too! Almost any location with elevation will do. Some locations operate from solar panels, so power requirements can still be met. Many offer free telephone patches and most don't

In general, a Repeater receiver listens to channel 'A'. The signal is processed and "repeated" (re-transmitted) out on channel 'B' with a stronger signal and with improved range. Almost everyone talks on 'A' and listens on 'B'. Repeater Control Functions take place on channel "C".

Other VHF operators are more than satisfied with Simplex operations. Direct contacts without the 'bells and whistles' appeal to the simplex user most.

Robert, get ready for some really nice features in todays modern FM tranceivers! Expect excellent audio and outstanding sensitivity. After years of working the HF bands, you will soon appreciate a true squelch too! All of the above features and more will soon spoil you.

In my estimation, Yaesu makes some of the finest ham communications around. Applause for the technical staff there too. Yaesu is strides ahead of oher manufactures I have used in the past. Kenwood and Icom both leave much to be desired if service is ever required. Most other brands go downhill from there.

DO take a moment to check-out JUN's home page. Each month they offer "Internet Specials" and just last month they offered a very nice YAESU, 50 watt 2-Meter Tranceiver for $249! That included PL, 40 memories and a *TouchTone mike too;
http://www.juns.com/radio/index.html

*DO get a copy of a current Repeater Directory. The ARRL version leaves much to be desired, but will do in a pinch. Ask your local radio store for recommendations. Here in Southern California, The Repeater Location Guide is the directory of choice.

* DO get a tranceiver that you can program. A minimum of 10 channels, please. Crystals are much too expensive to purchase for multi-channel operations. Make a portable/hand-held radio your second choice.

* Insist on P.L. (Private Line, sub-audiable tone) adjustable ENCODER. If the radio offers P.L. Decode as well, all the better!

* Most tranceivers offer adjustable power levels. This is a desirable feature because the lower power levels are fine for most repeaters and if you should desire to use your radio with a Gell Cell battery for camping, etc. High power is fine for most mobile operations, but in general, low/medium power will do fine in the city.

* A omni-directional gain antenna (Diamond or Comet) is a very good choice for base operation. Use good coax. Keep the run short. A simple ground plane is quick and dirty, but as long as you are doing a install, do it well. You can't work what you can't hear. A length of 1 1/2" EMT conduit makes a fine rigid mast. WATCH THE POWER LINES!

* For mobile work, a 19" whip antenna is low profile and can keep your radio a little safer. For gain, a 5/8 wave Larsen is a very good choice. Expect to pay about $50.

* Used radios CAN be a problem. Often it is a intermittent problem or the power output module may have low power out. In general, a used radio may save you $100 from the 'new' price, but can also present a whole array of problems. If possible, spring for that new radio and get a one year warranty while you are at it! If you buy a used radio from a dealer, make SURE some kind of warranty or 'trade-up' offer is included!

Robert, I hope you have found this all to be somewhat inspiring. Like you, I have a General Class license and a Kenwood TS-440S for my HF work, but I very seldom use it. You will find me on the VHF and UHF bands!

73's, Robert.

>lwyager@in.net

Well, before you box it up and ship it back to Yahoo, make sure
the KAM isn't lying. Hang a meter on the PTT line and see if the
KAM is *really* still telling it to transmit. Several things in
the KAM could be causing the problem. The PTT line has to be
held rather close to ground potential to keep the rig keyed.
The keying transistor in the KAM could be flaky, or the KAM
may be going stupid. Or it might be your interface cable isn't
quite as well made as you think.

Or, due to the rather consistent behavior, it could be a timeout
timer in the KAM expiring. I hear that they finally put a hardware
timeout in their TNCs so that when (not if) the TNC goes stupid it
won't leave your radio keyed forever as happened to me several times
with the KPC-1.

Honda is your best bet in the itty bitty generator range. In larger
sizes, IE 1-3 kW, Yamaha and Kawasaki also make good units. The
Coleman units are cheap, but they're cheap, if you get my drift.
Bigger than 5 kW, look at Onan and China Diesel.

>I would suggest to you that the two radios are not comparable; they are
>designed to meet different needs.

YES.

>The 706 is an adequate HF radio, but the receiver has certain drawbacks due
>to its design. Additionally, the radio's menu/controls are generally agreed to
>be hard to use since there are layers of menus in place of front panel controls.

I disagree emphatically. The control system is ideal for mobile use.
After about an hour learning curve, operating the radio becomes an
automatic thing, not requiring you to take your eyes off the road
to access most features. I think the interface is inspired.

>The 706 offers 6/2Ms, which is a huge plus for many hams.

YES. But for the all-mode aspect, not as a replacement for a 2m/70cm
FM mobile rig.

>I just made the same comparisons you are making; I chose the Yaesu FT-900.
>It is smaller by far than the 450S, has about the same capabilities as a base
>station radio, and has a detachable front panel. It does not, like the 450,
>offer VHF, as does the 706.

Good radio. I think it's a bit big for some of today's cars, and the
panel is cluttered, but it works very well on HF. No 6m or 2m SSB
of course.

4527. IC-706 RX

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-23 00:00:00 UTC
From: Darren Ream <dream@post.cis.smu.edu>
Message-ID: <31CDD8C9.42BD@post.cis.smu.edu>
Source record: 198984

I just purchased a 706 and it's a great radio. I agree the menu system is somewhat confusing at first, but it's no worse than a full-featured HT.
My only concern is that the receive level seems to be way down. I've compared it to my IC-2000 in the shack, and using the same antenna, the IC-2000 hears at S9 what on the 706 comes in at an S3 (w/o the pre-amp; w/ the pre-amp it comes up to about S7-8). I know it's not S-meter calibration, because a full quieting S3 signal on my 2000 isn't even heard on my 706. HF is the same story.
Should I bring it back to the dealer and have them check the receiver alignment? or am I overlooking something else (I've checked that the RF gain is wide open)?
It receives just fine when I run the pre-amp, roughly equal to my non-pre-amp equipped radios, but I feel the pre-amp should be good for extra receive, not just to bring it up to par.
Any suggestions?
Thanks,
Darren Ream, KC5OUH

From: Matt Strandberg <mattstr@primenet.com>
Message-ID: <4qkthi$buf@nnrp1.news.primenet.com>
Source record: 198987

Hi and thanks for reading this message. I recently acquired a 900 Mhz repeater, by RCA. It is a model RCA Series 900. I don't know much about it, but the Serial Number is 1285-T-064, and it is a rack-mount system. I looked it over, and I would like to get a service manual for it, and/or some information on tuning it down to the 902-928 Mhz ham band, and to switch out the crystals. I found the transmit crystal, but can't find the receive crystal (there are quite a few crystals; don't know which crystals are for what purpose).

If you have a service manual or some information on this equipment, please contact me.

Thanks and 73

> ..... etc, etc.................

Roger, It's good to see you getting the word out ...BUT.....

I don't think it helps anyone's position when they use incorrect
information to make a point, instead it makes the whole argument
questionable.

The FCC DID re-allocate 2 MHz of the amatuer band to commercial radio
users AND United Parcel Service (UPS) was one of the original supporters
of this because they wanted some nationwide data channels.

Now the rest of the story....

1. The FCC made this relatively small 2 MHz band into 200 5 (Yes, FIVE)
KHz wide channels and then let any commercial user file an application
for these channels. They got over 56,000 applications, each for up to 100
mobiles each!

2. The response overwhelmed the FCC and the radio manufacturers had to
develop 5 KHz channellized radios, so it took over a year to get this
straightened out before any commercial use was even possible.

Curiously enough, UPS was NOT successful in getting the channels they
wanted, so they went elsewhere (cellular).

3. Depite several lawsuits and other things to delay the use of the 2 MHz
band, there are a very large number of commercial trunked systemns now on
the air and working well.

A manufacturer call SEA, Inc in Washington state has been the unquestionable leader for developing 5 KHz products. They have been delivering repeaters, mobiles and SMALL size portables for some time now. Other companies are rumored to be delivering a few radios but they are very long on talk and very short on REAL products and a experience.

4. As far as "They have YET to use that frequency band", here in the Los Angeles area there are over 200 repeater channels ON THE AIR .. TODAY.. and over 2000 mobiles in operation and thousands of more on the way.

I know because I use one myself and I know people who are using 220 MHz commercial radios in every major city in the US.

I know it's hard for anyone to loose frequencies because they will NEVER get them back again.

I think there's a very inportant message to amatuers here, and it's simply "USE IT OR LOOSE IT!"

We can't let our emotions overcome the real truth about 220 MHz. It WAS not being used enough to prevent it's loss. The commercial use of the 220 band has exceeded amatuer use by miles, and its only started.

It's not just enough to just use the bands that just happen to come in the latest, cheapest imported ham rig. Hams HAVE to get back to building or modifying gadgets that use the spectrum we have, hopefully gaining the respect of other spectrum users for our imagination and creativity.

Let's not give up spectrum because it's not easy to use it!

Jack Daniel KD6YVL, A TECH + and damned proud of it!!!

>
> 73, TomThe last conversion article for the SB200 to 6M that I remember was in
QST back in 1967 or 68. At the time I said Aha the tubes do work on 6.
I built a 6M only amp quite similar to the SB200 design. The original
article used about 1 turn of the existing coil; the single band design
without all the strays had about 3 turns. Peformance was about 400W out
with a lower plate voltage (~15-1600 under load) since that was the
transformer I had. It can be done but efficiency will be poor if you
keep the existing plate circuit in place for other bands.

>department and skip ham radio.

Jim,

Not to take anything away from the wonderful job that many volunteer organizations do for public safety (which does include amateur radio). However, amateur radio is SO much more than just saving lives in order to fulfill a service. There such things as weather watches, public services in events (MS society use hams in some of its functions). Not to mention supplying "backup" communications in times of disasters.

Is amateur radio a hobby...yes and no. In order to prepare ourselves, our equipment must be checked, procedures tested, people trained. The best way of doing all these thing is to use your equipment and skill at all times. Therefore, after a while it does appear to be a hobby since all that we appear to be doing is taking with each other. However, in reality we are just preparing for the day when we might be call on to provide assistance.

Yes, there some hams that do take themselves to seriously...name me a hobby that does not have these. However, on the whole I have found hams to be willing to share their information and enthusiasm with people would are interested. Those people not interested in this service/hobby should not be bothered. Not because we are snobs but rather it is the correct and polite think to do (IMHO).

Not all of use can become volunteer fire fighters, but still wish to serve the public. There are many ways that this may be done...amateur radio is just ONE of those ways.

The only thing I've found that works is to build them in pairs,
then loan one of them to another amateur.

4544. FOR SALE: Icom IC-T22A & Astron RS-4A

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-23 00:00:00 UTC
From: dapence@dapence.com
Message-ID: <31ccc02e.1515845@news.pacbell.net>
Source record: 199105

For Sale

1: An Icom IC-T22A FM Transceiver in mint shape. It should be in mint shape because I bought it about 3 weeks ago for a purpose that is no longer needed. Still has it's box and manual and Icom's warranty.

2: An Astron RS4A Power Supply also 3 weeks old and in just as great shape.

Both for $250.00

If interested please e-mail dapence@dapence.com

Thanks

I will assume that you do not know the benefits that amateur radio has given
to this small community we call Mother Earth. When Hurricanes Andrew and Opal (I was in the middle of Opal) made landfall, it was ham radio operators who risked everything to maintain communications, NOT FEMA OR THE RED CROSS.
During and after the Mexico City earthquake, again it was hams who provided
communications because the telephone system didn't work. Same for the Los Angeles earthquake. And the volcano in the Phillippines. The footage you saw
on CNN when the Iraqis invaded Kuwait was sent out by a ham radio operator via Amateur Television. The first communications satellite put in space was not by a commercial enterprise but by amateur radio operators who developed the technology that enable your company to exist today. Ask your engineers and scientists which of them are hams and you'll find quite a few. The Vice President of the United States is a amateur radio operator. Most of the astronauts are hams. Most of the communication technicians and engineers in the military, I'm in the Coast Guard, are hams as well as in NASA. Taking of the spectrum away from us will also cause a loss of jobs in the high technology field because hams are not going to buy or build what we can't use. A loss of jobs will mean a loss of market for paging and other types of communication services. Your actions can and will effect everyone's bottom line.

There is a direct lifesaving aspect to the service, though that is
not primarily what I meant. I have had occasion to do just that,
however, when a trucker ran off the road, tore up 100 yards of
guard rail and was impaled by a piece of it in his cab. It was
late, there was no other traffic, and if I hadn't come along right
after it happened and called the rescue squad, there's a very good
chance he would have died.

But our service encompasses much more than that. Sticking only
with the public service aspect for a moment, there are the
thousands of messages and phone patches I handled for our
servicemen during the Vietnam War. Now few of those were directly
life and death, but they were surely important to the people
for whom they were made. That was of value to my community and
nation (helped the morale of our troops if nothing else).

But if you think our designation as a service only encompasses
emergency messages or health and welfare messages, then you

are sadly mistaken. Our service has four distinct charter purposes.

Every time I chat with a foreign amateur, I mean really converse with them not just try to extract a postal card in order to count coup, I do my tiny bit to increase international goodwill as required by our service's charter.

Every time I get a new circuit working, and share the results with others, I do my tiny bit toward the self-training and advancement of the art our service's charter requires. In fact, every time I can answer a question on the air, I do a little bit to help the self-training and advancement of the art aspects of the service.

This is a service our nation expects from amateurs, to increase the general technical literacy and skills of our numbers. That's important to the nation because we live in a technological age, and the more persons in the population who gain a working grasp of some of that technology, the better we can function as a nation.

And every time I log onto the packet network, or fire up the HF rig on 20m, I serve as a test load on the system, stressing it. Dr. Rohde credits amateurs with the improvement found in military and commercial receivers because only the amateur bands routinely put the sort of stress on the strong signal handling and selectivity of those receivers that the military would face in wartime.

We're the world's largest beta test organization for communications systems, and we not only do it for free, we pay for the privilege of doing so out of our own pockets. Because we are demanding, and have some technical skill and knowledge, we quickly identify flaws in equipment offered to us, and if we don't come up with fixes ourselves, we spur the manufacturers to do so thanks to the competitive marketplace.

No other radio service can duplicate those things to the degree which we do as amateurs. That we don't have to be paid to do it, and that we actually *enjoy* doing it in many cases, is just gravy. Bird watchers and stamp collectors don't provide those sorts of services to their nation or their communities. They just fill idle time with their activities. If that's all you do in amateur radio, then you are indeed not providing a service, and probably should be collecting stamps instead of occupying valuable spectrum.

Oh, and I *have* been a volunteer fireman too, and a member of the rescue squad, not that those activities are related to amateur radio in any way except as other services to the community. We all have a responsibility as citizens to try to make a difference, to improve our communities and our nation. Sometimes we do that through direct actions, and sometimes we do that merely by improving ourselves. The latter often receives far too little recognition as being

of value to the community and nation. Every little drop
of water contributes to the flow of the river.

This is symptomatic of a bad filter capacitor. Replace the filter(s),
and you should be set. Use a filter with equal or greater capacitance
and voltage ratings, and be check to observe polarity.

Good Luck, and keep 'em glowing,

Tony

Hi!

I just discovered my FT-900 has developed a curious "white noise" in the receiver!

The noise is S9 and can ONLY be heard between 1.800 Mhz and 14.49999 Mhz. Just one click of the main tuning knob beyond these limits and the noise COMPLETELY goes away. The receiver still works but copy (naturally) is difficult through the noise.

Anyone else come across this? I hate like hell to have to send it in, does Yeasu have any tech support?

4558. Icom Z-1 power output?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-24 00:00:00 UTC
From: kn4aq.gary@mms.net
Message-ID: <4ql0fa$af6@ralph.vnet.net>
Source record: 198997

Can anyone tell me what power output to expect from the Z-1, using the 4.5 volt battery? All the ads and specs in the manual give is 5 watts @ 13.5 volts. I'm getting just over 1 watt with the stock battery, and that seems kind of low.

Also, what are the differences between the "older" Z-1 and the "newer" Z-1? I'm refering to a short reference in the Amateur Electronics catalog about older and newer models.

Thanks and 73,
Gary KN4AQ

>73 de tom, la9gx

Tom,

I have been using a DTR2000L since 1988. Puts out 1200 W ON 160, 80, 40, AND 20 AND 1100w ON 15, BUT ONLY 800w ON 10. Works great for the price I paid for it and I have a source of nearly new 8877's for $200 to 250.

Only changes that could be made is better tank circuit for 10 and an outboard supply to boost power to 1.5KW.

>
I think the most important feature is either a "scan" or "seek"
function, or both. This will allow the radio to tune to strong
signals whereever you are. In most cases you won't know where to
tune. If you already have these functions (either or both) in
the radio you have, I wouldn't bother replacing the radio.

>John K4BNC
>
>

Hi John,

Experience with the 572 and 811 leads me to believe it would big trouble
putting 572 or 811's on six. With normal socket and grid grounding
arrangements, the 572/811 has a self neutralizing frequency in the upper
HF/lower VHF range. That's why SB200's, Clipperton L's, and other amps
with 811's oscillate on ten meters when their loading and tuning caps are
rotated to certain positions. That's why Heathkit, Gonset, Ameritrion and
others neutralize 4 811A tubes in GG (just for 30 MHz operation).

Without some knowledge and use of "trick circuits" an 811/572 six meter
amp would be very unstable. Without special circuits, stability becomes a
product of pure blind luck. A good way to increase "luck" is to decrease
plate voltage.

>tuners for patent infringement.
>
>Clark
>WA3JPG

A very good point Clark. Looking at the patent, there is nothing novel
anywhere.
Everything has been done before, and even the technical description isn't
accurate.

The question is, would anyone want to use a fixed cap to replace a
variable cap in a T. I say no, if you are going to reverse the
thing....just make it an L. Especially since the fixed C is only "optimum"
for one load impedance on one band.

As you say, anything can be patented. That doesn't prove the the idea
works as described, or even indicate the design is unique.

I agree here. Microsoft's decision has nothing to do with the
health of ham radio.

As for Kenwood, at least from my local experiences, they have had
quality problems. If they aren't selling enough rigs, they need to
look at their own doorstep. I don't see Icom and Yaesu complaining.

Even if the volume is dropping off, so what. There is a saturation point
in every market. The no-code license did what it was supposed to,
it got all those people in the door who were unwilling, or unable
to learn morse code. Now there is going to natural, expected slump.

I agree that it was a marketing ploy on Kenwood's part. Amateur radio
is just a small, small portion of their total business.

I have believed for a long time that they only keep an amateur division
around is for experimentation with stuff they would like to put into
their commercial equipment, but are unwilling to spend the R&D money
to perfect it before introducing it into a much more demanding
commercial market.

I run the AL 811A. It does cover WARC bands. If you have the 3 tube version
it puts out around 600 watts. The 4 tube version puts out 800 watts.
I really like mine; it is well-designed, easy to use, and very effective.

And with all this mumbling about commercial LEO satelitte systems, I'm
just so proud that I spent lots of dollars and two or three years
helping UOS do beta tests. Could turn out that the all the pacsats
should be sporting bumper stickers that read:

'I've Been Screwed Before, But it Felt Better'.

>Gary

OK, Gary, that's a description of what you do, and why you feel you
are performing a service. What percentage of hams do you feel fit
into the same catagory as you do ? I honestly think that a very small
percentage of hams participate in any type of public service activity.

In our local community here, that percentage is zero. Of the hams I
know in the U.S., none pass traffic, none do phone patches, and none
participate in any communications support activities for the public.
If I see a traffic accident or someone broken down on the road, I
call it in too, on my cellular phone. I will admit that I attended a
few marathons here a few years back when hams were supposed to
be providing communications support, but the activity was such a
disorganized mess, that I and a bunch of other hams felt we were
wasting our time standing on a street corner with an HT. So of all
the things you mentioned, Gary, I can only say that I personally have
been a beta tester, and as I mentioned previously, that may be for
the good of the public, but if the people who say the sky is falling
are correct, it didn't do much for the hobby.

To me ham radio is just a hobby. I don't feel at all committed or
obligated to anyone, as I passed the test to get a license and I
paid for all my own equipment. I'm sure there are lots of hams who
feel it is a service, but I am also sure that there are lots of hams
that feel it is a hobby.

If the FCC asked me tommorrow to answer one question,
'What have you done to justify the existance of Amateur Radio' ?,
I honestly would have to answer 'Nothing'. Unless passing out
30,000 QSL cards can be condsidered 'international goodwill'.

Maybe we were a while ago. Today we pale by comparison to the millions
of computer beta testers. And one cannot say that there is no technical
skill and knowledge involved in dealing with computers. Also one does
not have to learn an outdated mode of communications to prove their
prowess in the computer world.

Daren,

IICOM HF radios only meet the published specification with the preamp turned
on. With out the preamp the receive is unspecified, so you NEED to run the
preamp to meet the published spec. The other radios generally use a preamp all
the time and tuen it off when yopu press the attenuator button.

"Let he who is without sin, cast the first stone". Please tell us whether your operators had digital logic sending CQs and IDs, or a digital memory keyer, or a digital keyboard. If you/they were using anything other than a straight key, you/they are just as guilty. If you insist on manual for receiving then you must insist on manual for transmitting. It's not real CW unless everything is manual.

Shane,

Somewhere on the net (is that vague enough) are the mods for a $25 Radio Shack FM 49Mhz walkie talkie. I know it doesn't sound like fun but it's how I'm going to get on 6M FM. I think the model was TRC-515. It's a single channel crystal based radio. The gist of the mod is; change the rocks, retune the final, you're on the air. :) So $30-40 and you've got a QRP 6M FM transceiver.

There is a 5 channel model that the author did not reccomend since I think the tuning is much more difficult. If I can find the article I'll mail it out to 'ya. My current project is getting an old HT-40 to do 6M AM, one of those things I just gotta try!

>I will never put an amp in my station because I can do the same things
>with it with 100 watts, 5 watts and 250 milliwatts! Good luck!

As you gain more experience, you may want to modify this statement slightly. An amplifier can be useful under certain conditions, such as 160m and 75m in summertime when the atmospheric noise levels are very high. An equivalent noise temperature of 1,000,000 K is not unusual here when there is thunderstorm activity in the first skip landing zone. There is a place for amplifiers on HF, it's just not as large a place as some seem to think.

If you need to meet a schedule or check into a net under marginal conditions, an amplifier can be an asset. However, if you are just looking for random contacts, and are willing to follow the MUF, then much lower power levels will suffice. I was recently able to follow a Pennsylvania beacon operation on 40m down to the 100 uW level (that's *microwatts*) from down here in Georgia when the MUF fell down close to 40m in the wee hours. But for daytime use, you'd need quite a bit more power to overcome absorption losses.

Hi!
Has anyone compared these 2 dual-band HT's? I have the 508a but recently moved and need a little xtra watts to get out of these hills while portable. Really like the size of these rigs so looks like its the FT50 that comes close to the 508? Aside from the obvious (power out and TTP) has anyone compared the performance out-of _band performance, sensitivity,etc. You'd have to pry the 508a out of my dying hands..but then the xyl would make sure I was dead if I brought another rig into this place<g>.
Txs..

Correct me if I am wrong BUT .....

Who said continued growth is a good thing?
Sixty years ago the joy of the hobby was for two
operators to make contact with rigs they built and
antenna's they designed.

These days the bands are crowded with Ham
want-to-be's, DJ want-to-be's and people who
wouldn't know good manners if they jumped up
and bit them.

I for one say its time for this hobby to
down-size. Maybe those people who get their
license and then spend all their time bad
mouthing the hobby will find new things to bad
mouth (like net surfing). The true joy of amateur
radio will always be there no matter how much it's
bad mouthed.

X-Newsreader: TIN [version 1.2 PL2]

CW has a major advantage over phone. It can get thru where voice can
not. ESPECIALLY for emergency communications. It has the ability to be
used over longer distances and still be readable. It is EFFICIENT for
those who are motivated enough to learn it. CB is for the lazy; not
Amateur Radio. I got my Tech+ in may and was harrased mostly by techs
that thought I was stupid for bothering with code. I know personally
that these are also only interrested in their radio as a cb
replacement. I pzarticipated in Field Day this week end and tried some
phone but kept comming back to cw. I totaled about 12hrs cw. ^hrs in
a single stretch and I had more fun in there than anywhere. Maybe my
10wpm isnt great but it was successfully fun.
Try it and have a positive outlook. It isnt hard, it just take some
actual working to build up. you cant be lazy, but it pays off!

Millions of beta testers?? Maybe if there were some quality and a little
alpha testing, those of us in the indusry wouldn't have to be "beta" testers.
I can tell youafter 25 years in computers there is really a shortage of true
technical skill and knowledge out there. Sure there is a lot of hear-say and
nay-say, but very few people have the knowledge to do anymore than regurgitate
what someone else has done. Many people have successful computer careers and
know little or next to nothing about them or how they work, only what they have
"learned" to pass a certificate or some such. Gone are the days of knowing
ebough about something to actually understand and fix it.

Maybe some should learn outdated information as this often is the knowledge
base for the technology of the future. There are certainly a lot of high
ranked business people out there who know enough of the buzz words, but very
little of the actual technology....

If the military are dumb, does mean we have to be. As for the truth of
that, I hear that elite units are still using CW as the most reliable
comms and that many units are REINTRODUCING CW training. :):)

If you saw that movie on the guys who crashed in ALERT North Pole you
saw that they had to ressort to CW type communication to talk to the
search party because their battery was frozen (That was not fiction).

I don't know where the info is on the Net, but conversion articles are
in the UK mag. 'Practical Wireless' April 1995 (orig. article); and May
1996 (follow-up; mods for more power - nearly 90mW!). Range between a
pair modded as stated is quoted as almost 3/4 mile in flat countryside.

Model covered is TRC-501 which is probably same as TRC-515 (same basic
spec). AFAIK the 5-ch. radio is synth'd and said to be unconvertable.

I have a pair of TRC-501s; not converted to 51MHz as they are more
useful as-is - only legal way in UK of radio comms between unlicensed
private persons. I use them for car-to-car or at outdoor events; as long
as there are no baby monitors nearby (same frequencies; continuous Tx!)
they work fine, though range unmodded is from 200 ft (car - car) to 1000
ft (across an airfield).

As PW publish their Net address in their mag, I see no harm in quoting
it; for the Editor, it's rob@pwpub.demon.co.uk.
Phone +44 1202 659910; Fax +44 1202 659950. Sorry, but I can't find a US
distributor's address in the mag.

BTW your request for info may answer a question I was going to post to
this ng, as to whether any HTs are available in the US for 6M FM (I

already have an FT690R2 'electronic handbag' but really want a TH77E - sized 6M HT, esp. as now we may be getting repeaters here on 6). I imagine there are none made!

Hope this helps!

Do you think it's that different in the electronic technology field. Heck it's the
same in any field. There are those who excel, those who follow and those
who just fall by the wayside. If there are so many great "beta testers" in
ham radio then why is there so much crap being sold. When is the last
time that any of the big three ham radio manufacturers put out a handheld
that didn't suffer from extreme intermod. Other than a couple of mobile
vhf radios all the others have front ends looser than a hookers crotch.
VHF/UHF radios have become basically scanners with ham bands
thrown in as an afterthought. And sure some of the newer HF rigs
have introduced DSP, but other than that I haven't seen a rig worth
giving up my ICOM-735 for. And even the new higher entry radios have
some serious flaws that indicate pretty shabby "alpha" or "beta
testing or very poor quality control.

All I'm saying is that we are living an illusion if we think ham radio
reigns supreme over all other technology. And to those who
do think we are better then I ask why is this hobby not growing at
the pace of the computer hobby? Obviously there are a lot of
people in that industry that are on the cutting edge of technology.

Message-ID: <31CF3027.71D8@osi.com>
Source record: 199138

I'm trying to price my FTdx-400 for sale.

It's reasonably clean with one 1/2"" hole drilled in the removable top cover.

To the best of my knowledge, it's had 3 owners.

I have some spare tubes (including used 6kd6 finals), manual + schematic.

It will also have an Astatic Lolli-pop w/Shure element mic.

Reason for selling: Bought new rig.

This is NOT a 4 Sale querie, but rather a quest for pricing info.

PLEASE RESPOND VIA MY E-MAIL ADDRESS.

Thanks in advance for your information!

You got a fairly good deal on that mod. Do you know who did it? I saw a mods place indoors at Dayton, but they wanted over $200 to do both of these mods. I would have paid the $50. The cellular mod involves installing two diodes in pads near J5. Unfortunately, the diodes appear to be more of these surface mount gizmos and in order to find J5, I'm going to need a parts placement diagram. Does anyone have one of these?

I love ham radio and wish that I could find some group in my area to
administer the Technician test so I can be licensed! What do you mean by
placing those overprivelaged snobs in a group with the
</BLINK>NORMAL</BLINK> people. I'll be happy to take a 2M!

4607. Old Motorola VHF??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-24 00:00:00 UTC
From: Chris Davis <cdavis@ptel.net>
Message-ID: <01bb6183.53e5cdc0$185c09ce@cdavis>
Source record: 199146

Forgive me if this is overly elementary, but I'm pretty new to amateur radio!

I bought a bunch of old Motorola VHF equipment at an auction several years ago (for no reason other than it went really cheap!) One of the units is the base unit, a fairly large gray cabinet. I can see no model number, but do know enough to see that there are two 'modules' that control the frequency (since the frequency is stamped on the top of them!) I assume one is receive, and one is transmit. They are currently at 151.895 MHz. How would I go about modifying this to work on an amateur frequency, specifically 146.280/146.880? I've just moved to this area, so I really don't know any local hams to ask for assistance. I did notice a date stamped on one of the pc boards, it was 1973. Also, any clue as to the output power on this unit?

I'm in need of documentation and/or manual for MIRAGE D15 (UHF 15W brick).
Will pay copying/postage costs if you would be able to make a copy.

Please e-mail -

73 Dave WB0GAZ dgf@netcom.com

>
>Thanks.
>
>Larry, KE8GW
>
>

Hi Larry,

That refers to J. Fred Riley...WA8AJN. He published some mods in CQ or Ham Radio years ago. You might try to contact him directly.

Fred is a bright guy, and has been messing with amps for a long time. Even though he was never louder than me on 3895, I'd still trust his mods.<grin>

One of the mods dealt with tube protection, the other ALC.

He's a real good tech guy for this, since he worked a lot with lower power amps like the MLA2500.

4614. Help - Kenwood UT-28s in 741

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-25 00:00:00 UTC
From: Len Revelle <lenrev@wwa.com>
Message-ID: <31CFC246.218B@wwa.com>
Source record: 198818

-- I just installed the UT28s in my 741 which is remoted in a '97 Ford truck. Not wanting to drill another hole
I am playing with a glass mounted 11 meter antenna retuned for as low an SWR as possible. Nope, won't get to
1:1 but that's not the primary problem(s). (any suggestions for proper pruning of a center loaded glass mount
would help as well)

1. Regardless of the antenna used (tried roof mounted Larsen and my Hustler on the rear bumper) I note the tx
lock in transmit. At 25 watts (all I get out in high power position) it locks 99% of time requiring turning the
rig off to release. At medium power it usually locks and releases 1-2 seconds after releasing PTT. At low power
I generally see no locking.

2. At both mid and high power levels I see signal strength readings in the UHF receiver when I transmit on 10.
The signal strength varied with amplitude of my voice. This does not occur in the VHF receiver.

3. I also noted a lot of noises on 10 apparently eminating from the truck that aren't problems on the other
bands.

One concern is that Kenwoods instructions are to remove the shied plate from the module below the UT28s
prior to it's installation. I'm putting it back if assembly allows.

I've strapped the coax shield to a sheet metal screw installed in the truck body and the control cable
has a snap choke installed at the radio end. I suspect near field radiation at the control head which is all
plastic as the locking seems to vary as I move about in the cab.

Anyone else experience this or similar problems? TIA

Source record: 198819

I just bought a new DR-605T.
For everyone wondering, it's a good radio.
One kwirk, the squelch is digital and you can only adjust the band that is
active, no squelch knob.
It's not bad for intermod.
The mic is kinda cheesey

Does anyone have any mods for it yet?

Jabran

> We've known that for decades. Of course when SSB can get through,
> it has higher throughput than OOK Morse. But both are bottom of
> the barrel methods compared to Clover, PACTOR, etc.
>
My experience with military comm (TSC-60 crew, 242 CCSQ, WANG) leads me to
believe that the bulk of military traffic is unsuited to CW because of
it's low throughput. 75 baud TTY and such are only used as the very last
resort because even they are so slow. In today's military, where just
about everybody and everything moves above mach 2, every piece of data
must be relayed ASAP because lives depend on it.

Sure CW will always have a place.....ELF submarine comms for example. But
there just isn't, and won't be, the demand for CW that there once was.

4617. Jammers caught in Oregon by PARG

PRESS RELEASE - PRESS RELEASE

Phantom s Amateur Radio Group, Portland, Oregon Phone (503) 818-PARG

ATTN: All Newspaper, Newsletter, and Magazine editors
(printed or on-line)

The following is an announcement of a local ham radio group catching a person causing malicious interference to a Police department radio system. Please feel free to publish. Send e-mail to mscott@teleport.com if you would like an electronic copy of this release sent to an e-mail address. 6/24/96

<START>

During June 1st, 1996 in Seaside Oregon, where the SEA-PAC ham convention was being held, a group of hams belonging to PARG (Phantoms Amateur Radio Group) were down on the beach front enjoying the annual PARG bonfire. One of the hams (KB7YZS) was monitoring the local Seaside Police Dept. He heard someone cursing and yelling at people. At first he thought it was coming from the UHF side on his hand-held transceiver, but to his surprise it was coming from the VHF side which was monitoring the police.

He promptly notified everyone at the bonfire to listen. After a few minutes of listening to the person, the members had figured out that the person was up in a balcony, was with 3 or more people and 2 of which were females. They realized this because of key things he said and voices in the background.

The 4 PARG members in the group (KB7YZS, KB7YZR, N7XMD, and AA7UP) just happen to be most of the PARG Interference Committee. They immediately activated the PARG Interference Committee direction finding operations. They promptly tracked down the interference to a specific location of the Shilo Inn and searched for someone matching the description. After only 5 minutes they saw a group of people on the third floor of the Shilo who matched the description. Then they saw him pick up his hand-held transceiver and speak into it. At the very same moment the voice on the police frequency was saying "Hey, fat ass, yea you in the black pants and the white shirt". While he was saying this on the Seaside Police frequency the members noticed a man wearing those clothes, a little on the heavy side walking directly underneath them.

One of the PARG members saw a Seaside Police patrol car in the area. A PARG representative approached the officer and asked him if he was looking for a person causing interference to the Police Frequency. He seemed very upset and replied "YES"! The PARG representative then informed the Seaside Police Officer where the malicious interference was coming from. Three other PARG members were on their way to the third floor when they saw the people (from the room/balcony where the interference was) come running down the stairs and away from the Shilo.

The officer took a report from the PARG representative, including an exact location of the motel room and spoke to the hotel manager. After 2 hours the interference started up again. The Seaside Police Officer went directly to the room the PARG Interference team pointed out and caught the person in the act of doing the deeds.

The above is known to be facts. The above mentioned is knowledge from speaking the PARG Interference Committee members and to a friend of the suspect.

The man who in is question has a call sign of KE6VNU and is from Central California. He apparently was in Oregon for the ham convention. Information indicates he was released from jail only a short time before this incident, the charge he was in jail for was malicious interference to the local police in his area. This obviously did not teach him his lesson. We understand that he caused a great amount of interference to the Sacramento County and Roseville emergency/public services communications and often identified himself on those malicious transmissions as "The Phantom Jammer". We were told the charge Seaside Police brought against him was "Interference of a police officer in line of duties".

Note: It is an unfortunate coincidence that the malicious interferer used the name "Phantom Jammer". He has absolutely NO association with or relation to PARG (Phantom's Amateur Radio Group), the group which located him & turned the necessary information into the Seaside Police which led to his arrest for the interference. We did not release this information until now at the request of the local law enforcement officials to prevent tainting their investigation.

This was PARG's second year in a row of providing public services during the Seaside Ham Convention. Last year several PARG members apprehended a purse thief (after a brief foot pursuit), returned the purse to the rightful owner, and detained the suspect until police could arrive. PARG also performed crowd control activities at this time due to the large number of people who stopped to watch the purse thief incident.

PARG is the Phantom's Amateur Radio Group in Portland, OR and is Portland's most active VE testing, repeater club, emergency communications, and ham radio group. Please visit our web page at "http://www.teleport.com/~mscott/dumb.shtml".

Web Page is at Kantronics.com ...

E-Mail addresses are:
Sales - sales@kantronics.com
Service - Service@kantronics.com

Did you try one of the Web Search sites? "Yahoo" is excellent, and
probably would have found them almost immediately ... I tried it, and
came up with three matches for "Kantronics", the third of which is their
corporate Web Site. Yahoo is available thru the web at
HTTP://www.yahoo.com/, and is available either in a graphics or text-only
mode.

73, and good luck!

As a convention, or a standard, the following applies:

Below 10 MHz, use LOWER sideband

Above 10 MHz, use UPPER sideband

in the amateur bands.

Most military and commercial stations use upper sideband at most times -
but you will find exceptions (as well as double-sideband emission, which
puts different information on each sideband).

73, and welcome to the hobby!

4624. Re: FT50 v. 508a

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-25 00:00:00 UTC
From: childers@garlic.com
Message-ID: <4qp3qk$189c@quake.garlic.com>
Source record: 198828

I own both the 508a and the FT-50... I love them both. The 508 I carry all the time when I know I'll be close to a repeater... it works perfectly for me in those situations.

I have the FT-50 with both the high and low power packs, and with the low power pack the radio is just a tad bigger than the 508... but with many more features. I usually carry the 50 when I know that the 508 isn't going to cut it...
I only have two gripes about the FT-50... First, compared to the 508, the 50's antenna is much longer. Yes, I know that that translates into better receive and more gain on output, but where I usually operate that doesn't make much difference. I have used the 508's antenna on the 50 with much success, so much that I'm going to place an order with Standard for another 508 antenna for my 50.
My second gripe about the 50 is that some people have complained about the Tx audio being low. I've a fix, however. If the battery is taken off and the NiCd sticker removed, you expose the VHF and UHF deviation adjustments. The leftmost pot is the VHF, and the middle pot is UHF. DONT TOUCH THE RIGHT POT! That controls the PL tone frequencies! All I've done to my 50 is to twist both VHF and UHF pots about 1/8 turn clockwise, and my Tx audio problems are a thing of the past.

The bottom line is that the military has VERY deep pockets that allow
them to use the latest in technology,.....on BOTH ends of the QSO.
As Hams we have the Fella with a IC-775, computer, three or four
towers with monobanders, talking with a another Ham with a homebrew
rig who's VFO swings with the varying line voltage in his country
(listen to Cuba lately?). To compare the ARS with the Coast Guard or
any other form of the military is comparing apples and oranges. I
guess since Cecil got his Vanity call he lost his sense of humor.

Source record: 199015
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.misc

I would like to respond with two points here:
1) History is once again repeating itself. A while ago E.F Johnson said nearly the same thing when the CB craze was catching on. They cut their ham radio line and went full force in the CB market. A lot of hams remembered this when the CB craze ran it's course, and the Johnson Ham gear didn't sell either. Too bad, the Johnson gear was usually top quality, but that doesn't override a bad image.

2) Even though we don't like it, Kenwood is sending us a message to which we should react positively. Even though it may not be totally true, ham radio IS ailling. We need to stop bickering, start thinking positively more often. We need to accomplish some major breakthroughs through a combination of synergism, persistance and expertise. An example: we have the expertise among us to create a mobile data network that could pale any commercial system out there. All we need is the desire to accomplish something like this.
Jim W0oog/5 in Plano TX

I've been extremely happy with mine...easy to install and easy to use. I had it in the truck with a little over 3 hours of work (with most of that dead time explaining to my brother what I was doing! :)

It's a powerful little radio...I regularly hit 146.88 here in Raleigh from Haw River to the west to East Fayetteville in the south.

When my stepfather gets his ticket, that's the radio I'll install in his truck.

I have a friend about 30 miles away and although we can talk via a repeater, I would like to see if we can communicate without it. I only have an HT dual band, so I only have 5 watts to work with. Does anybody have plans for a directional antenna for either 440 or possibly 2 meter and 440?

Thanks.

The capabilities depend on what options are in it. What are you going to use it on? If you are going to use it on the Mitrek base station you should have the Enhanced VOX option. Look at what plug in boards are in it. If it has one that says MTEV, that's the enhanced VOX. That provides a 1/2 sec voice delay so the phone line audio is not clipped on the first sylable. If you use it on a repeater you don't need it. Also look at the PROMS in it. You probably want the Multiple Utilities option. Without that option, the access code is either * or #*. With the option you can program in a longer access code. The manual # is 68-80309E12 and Parts has them in stock for $15. Good luck with it.

YEASU DOES IT AGAIN!!!!!

(to the consumer that is)

(the ft-50r what next)

1. no way to charge the battery off the radio (slow charge)

well have no fear for a few extra bucks they have one comming out soon!!

2. The filter is wrong (oh well I allow one screw up)

3. The voice mail paging system don,t work! (why the hell did I buy the

FTT-12 for?)

4. I remember Yeasu at the convention laughing at Kenwood for forgetting

a skip function on thier radio !!! (they were saying hey looky here)

5. will Yeasu lower the price of thier ftt-12 at least to compromise

for the reduced functions of thier product (Hell no baby needs a new pair

shoes!!!)

6.In my humble opinion (this is my opinion)

Hello all,

I am looking to get into 6m ssb, and I have a some-what limited budget.
I would love any information that you have on the MFJ 6 meter ssb rig..
Any good... Comments suggestions..
How much "modification" will I have to do to the rig before I get it
to work right?
(I had a 1276 TNC .....That is another story..)

Any help would be great.

hi,

I am searching for any description of the following camera model:

- color CCD-Camera Modul
- manufactured by AT&T
- ID: Video Camera PV Camera 200-NTSC /201 PAL

this model can be pluged to a computer-card. therfor there is a conector
with about 8 (i don't know it now) pins.
an other conector is for the vidoe output and the power surply.
it works all fine, execpt if there is to many light.
i think, as it is a computer camera, there must be an option to regulate the
chip or something in this way.

any help is welcome, also the description of the other pins at the 2
conectors.

thanks for answering ;-)

ps: please send any infos as a PM to

Message-ID: <199606251307.00055118@mgdmug.org>
Source record: 199032

I have read some reports on this and other lists about audio problems on the ICOM-706. I have had mine for a few months. As I recall some people have said it has good audio. But recently a couple of fellows, who I thinks are careful
listeners, suggest that the audio on SSB is somewhat narrow and restricted, like a Heil DX mike. Has anyone else noticed this? Is the problem just in the microphone? Any solutions?

I use a Kenwood TM-733A which I like quite a bit. I don't live in an area where intermod is a problem, but I once drove through St. Louis and found that the "Advanced Intercept Point" knocks down the intermod pretty well. The 733 has wide-band receive on both bands (wider after you perform the Beyond Mars mod), and plenty of memories to handle most of what you want to listen to. My only gripe is that it scans quite slow. I would still recommend this rig to anybody.

73 de Nick Hulst, AA0VY
(Oh by the way--the 733 is remote-controllable from your HT, although the manual doesn't tell you how. Go to http://www.qrz.com/mods to find out how to remote control and cross-band repeat!)

4650. Distributer of an M 57729 RF Amp

From: bnr@universe.digex.net
Message-ID: <4qpb1g$8lt@news4.digex.net>
Source record: 199036

I'm just about ready to take my exam for my Tech license and think it is about time to start looking for my first HT. I'd like a dual band and as a long time scanner nut, I like the FT50R extended RX.

What I am wondering is does anyone have any comments on this radio. What are its good points and bad points? What kind of accessories are useful? Should I go with 2 watt or 5? and what are the differences in the different batteries? And what other radios would be in the same price range and worth comparing?

I know its a tall order, but if you have any experience with the radio - I would love to hear whatever you have to say...

Thanks in advance,

You should always do that first thing for any radio you intend to keep. The service manuals seem to go out of print quickly.

Ok, now here is what I think you will find. I think you'll find that the correct LO is being selected, but that *it* has developed a problem causing it to generate lots of noise. The transistor or varactor could be acting like a zener "noise source", or a bypass cap may have failed.

If you can scrounge up another receiver which will cover the LO range, make a "sniffer" loop and hunt the source of your noise. I expect it'll be coming from the selected LO.

They *do* Cecil, it is called the STANG HF modem, works even better
than PACTOR II (and *that* works lots better than OOK Morse). That
OOK Morse can get through where SSB can't isn't exactly hot news.
We've known that for decades. Of course when SSB can get through,
it has higher throughput than OOK Morse. But both are bottom of
the barrel methods compared to Clover, PACTOR, etc.

4655. Re: MFJ 6 meter rig any good? Help!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-25 00:00:00 UTC
From: fedpress@omnifest.uwm.edu
Message-ID: <4qpdb9$2l2@omnifest.uwm.edu>
Source record: 199040

Here's a little anecdotal info...

A local here in southeastern Wisconsin worked Mississippi using one of those 10w MFJ rigs using a dipole strung up in his (ground floor) living room!

I myself worked a guy in Colorado Springs who was using the MFJ with a very low elevation dipole.

For what it's worth, the latest (July) issue of the British ham magazine "Practical Wireless" carries a review of the MFJ 6m rig. It indicated that MFJ was apparently having serious quality-control problems, at least initially.

Hi Paul. I think you can simply install a different tx mixer xtal on a
switch. I think the stock tx mixer xtal is a 10.something mhz. Look into
yours and let me know. I have a couple of spares left over from a recent
10 meter conversion project, and may have what you need. The xtal change
is a lot easier than pll mods.

> but the audio is kinda crappy and listeners
> report a wide, mushy signal that lacks base response.

I confirmed with listeners that turning the carrier offset to -200 improves
the bass response with the hand mic.

> 2. When using my Heil on the old IC-751A, I had to build a preamp
> circuit to get the Heil to adequately drive the Icom. Is the
> same true when running the 706?

I wired up my Heil desk mic with an ethernet RJ-45 plug to 4-pin mic connector
and was disappointed that the audio level was so low. If you don't have the
compressor on, forget it--if you do, it's pretty weak. I am guessing you'll find
this too. I'm no impedence guru, but possibly there is some sort of coupling
that's work better to be used I am unfamiliar with.

> 4. Where do you, IC-706 owners, run your mic gain, compression level,
> and carrier-shift? What settings ? I usually keep mic gain at
> 6 or 7 (depends on HF band), Compression at 12:00, and carrier
> shift at -100.

Mic gain is stored by individual band, so ensure you check the Q menu for each one!
(It may even be stored for each mode by band and memory channel--I am unsure). I
had too much background noise reported with the car window open on 2 FM when mic
set above 4. On HF, it seems like 5-10 works okay, so 7-8 works for me. It seems
to me like far too many folks talk too loud into their mic, so try different
distance from your mouth if you can't control your enthusiasm. The compression
level I adjusted per the manual (be sure to count all the way to and say "five"
when testing to ensure you get a real audio peak). See above on carrier.

>If you succeed with this mod, you are certainly to be congratulated!
>
>
>

Unfortunately you are sadly mistaken Yves

I certainly don't expect something for nothing! There ain't no such
thing as a free lunch!

However, knowing the lead times for HRT articles (sometimes over 12
months), I did wonder whether such an item would be better published on
the internet first.

Sadly the UK 4M is very much under used and with such a mod on the
loose, owners of IC706's like myself, could quickly increase activity
100 fold!

many people still do not have access to the web and I am sure 99.9999%
of HRT readers would still buy that issue anyway - regardless of the
mod, and indeed many others would buy it for the mod too.

Although not a direct attack on Chris or Sheila, IMHO there are many
amateurs involved in the industry only too quick to make a fast buck out
of the hobby - irespect of whether its their hobby or work - the same
goes for many other hobbies too. A conflict of interest perhaps?

Its also a sad fact that many people in the hobby can only ever make
negative criticism of other peoples comments too - get my drift.

Keep smiling Chris!

Here we go again! I wish Icom would put in their manuals how to adjust this.

Get into the menu, Q4. Change your carrier frequency to about 0 or a bit lower. This will give you all the lows you need. The 706 has great audio now! 73

Bill Combs (Bill_Combs@mgdmug.ORG) wrote:

HI
I recently posted a msg saying that I'm a white stick op needing help using an Icom IC706.
I received no replies (probably because most people would think that wihtout sight it would be very difficult to use this rig.
I am pleased to say that with initial help in setting up the rig I am able to use all the essential functions and am fast learning the others.
However, the ideal would be to operate the rig with a computer (I have a PC with a speech synthesiser). I have as yet found no software to drive this rig and would appreciate any help in locating it, preferably demo versions so I can see whether the software will work with speech, and preferably via the Internet as this would save me time.
Any help welcomed.

Source record: 199051

I'm relatively sure TT quit making the Titan because the overhead on them was extremely high and the profit margin just wasn't there...

Additionally. I owned one for 2 and half years. I ran it everyday, worked it for contests, dx pileups, general rag chews, etc. I never had a finer amplifier. Absolutely rock solid, reliable and rugged. The huge outboard power supply gets all the heat (except tube heat) out of the rf deck. My power supply transformer did develop a "buzz" but that was easily cured by tapping a couple of shims under the strapping around the laminates of the core.

The tubes are expensive, true, but if you are careful about SWR and antenna selection, watch the drive level from your exciter, the amp should serve you well for many ;years. Just like any other fine piece of equipment, handle it with care, use good judgement and don't expect it to do anything out of the ordinary.

I found that with a small modification it worked well on all bands, too.

This is a great amplifier. I sold mine when I reduced my ham radio activity a couple ofyears ago, and I regret having done so now, especially because they are not building them anymore. I'd buy another one in a heartbeat.

Because you will be buying a used piece of equipment, look for obvious overheating problems, burned leads, etc...any other signs of abuse. Check the full break in capability, the machanical relay sometimes goes bad...and its expensive. They use a mechanical vs a pin diode matrix because of the reliability factor.

If you can, have the owner load the amp up into a big dummy load or on a dead band. The amp should easily deliver 2000 watts with about 100 watts of drive or less. It should loaf along at 1500 out. I used mine for CW contests and the air from the tube chimneys hardly got warm!

Good luck. It's a good piece of gear. QST reviewed it, as I recall, and that would have been in about 1989-90 or so.

>
> Thanks Icom for 'making it right' after the delay.

Well...I have just the opposite viewpoint! I have been strung along by Icom that the cables were backordered, but was SHOCKED to see, not the "few weeks" they told me, but now (in the letter), 3 MORE MONTHS!! I really need the cable to complete my auto installation and move away from the temporary installation that's kind of dangerous in my case and has limited my mobiling.

Since the cables are readily available for purchase ($50), it strikes me as very strange we're looking at 3 more months "for more." BTW, I think the bracket is worth only half the cable (or should I say the overly inflated retail prices they are charging are 2x apart), so I don't see any "making it right" when you come right down to it.

|> Albert
|> alozano@cae.wisc.edu

Albert :

These were sold in the U.S. a few years ago by JCOM (now bankrupt).
A few of us managed to buy one from Ramsey who were having a sellout
last summer (they bought out the JCOM stock).
AEA, sold what appears to be the same radio under the name DX-Handy
a few years ago as well.

I don't think that there is anyone in the US that is currently
selling these rigs.

They are single band Superhet SSB & CW (no sidetone, manual tr/switching)
with 2 crystals and a VXO giving 50KHZ per crystal
(selected via a 2 position switch). Also includes a noise
blanker, RIT, BNC antenna Jack and top mounted jacks for Microphone and
speaker, plus a top mounted momentary switch for CW. The bottom of the
rig has connections for external power / battery charger, external CW
key, and a SSB/CW switch. It can be powered via AA alkaline or Nicads
and output is 2 Watts. You may also connect an external 9.5V supply.
They are HT sized and shape, slightly bigger than most of the VHF HTs,
and also have a built-in speaker and MIC.
Models were available for most bands from 80m to 6m.

Let us also not forget that Bill Gates is also the main man behind the X-files (a government front program explaining mysteries that way the govenment wants us to know them). Also, Hitler is not dead, a 9000 lb baby was born to a 1 day old infant in the oval office and the FCC is run by the unabomer.

The government is watching - you may now become so paranoid that you turn to drugs, supporting the defict by paying the columbian drug lords who got Clinton into office. Also, Mr Clinton is a changeling and Bill gates is a KGB agent and quite possibly a Borg.

Hi Kieth, If I remember right, modulating a 10.7 MHz signal and then mixing it with a 3.5 MHz signal results in 7.2 MHz and 14.2 MHz. So these early (cheap) SSB generators resulted in LSB below 10.7 MHz and USB above 10.7 MHz and the convention is still in use although there is nothing to keep someone from reversing the sidebands with modern transceivers.

PRESS RELEASE - PRESS RELEASE

Phantom's Amateur Radio Group, Portland, Oregon Phone (503) 818-PARG

ATTN: All Newspaper, Newsletter, and Magazine editors (printed or on-line)

The following is an announcement of a local ham radio group catching a person causing malicious interference to a Police department radio system. Please feel free to publish. Send e-mail to "mscott@teleport.com" if you would like an electronic copy of this release sent to an e-mail address. 6/24/96

<START>

During June 1st, 1996 in Seaside Oregon, where the
SEA-PAC ham convention was being held, a group of hams belonging to PARG (Phantoms Amateur Radio Group) were down on the beach front enjoying the annual PARG bonfire. One of the hams (KB7YZS) was monitoring the local Seaside Police Dept. He heard someone cursing and yelling at people. At first he thought it was coming from the UHF side on his hand-held transceiver, but to his surprise it was coming from the VHF side which was monitoring the police.

He promptly notified everyone at the bonfire to listen. After a few minutes of listening to the person, the members had figured out that the person was up in a balcony, was with 3 or more people and 2 of which were females. They realized this because of key things he said and voices in the background.

The 4 PARG members in the group (KB7YZS, KB7YZR, N7XMD, and AA7UP) just happen to be most of the PARG Interference Committee. They immediately activated the PARG Interference Committee direction finding operations. They promptly tracked down the interference to a specific location of the Shilo Inn and searched for someone matching the description. After only 5 minutes they saw a group of people on the third floor of the Shilo who matched the description. Then they saw him pick up his hand-held transceiver and speak into it. At the very same moment the voice on the police frequency was saying "Hey, fat ass, yea you in the black pants and the white shirt". While he was saying this on the Seaside Police frequency the members noticed a man wearing those clothes, a little on the heavy side walking directly underneath them.

One of the PARG members saw a Seaside Police patrol car in the area. A PARG representative approached the officer and asked him if he was looking for a person causing interference to the Police Frequency. He seemed very upset and replied "YES"! The PARG representative then informed the Seaside Police Officer where the malicious interference was coming from. Three other PARG members were on their way to the third floor when they saw the people (from the room/balcony where the interference was) come running down the stairs and away from the Shilo.

The officer took a report from the PARG representative, including an exact location of the motel room and spoke to the hotel manager. After 2 hours the interference started up again. The Seaside Police Officer went directly to the room the PARG Interference team pointed out and caught the person in the act of doing the deeds.

The above is known to be facts. The above mentioned is knowledge from speaking the PARG Interference Committee members and to a friend of the suspect.

The man who in is question has a call sign of KE6VNU and is from Central California. He apparently was in Oregon for the ham convention. Information indicates he was released from jail only a short time before this incident, the charge he was in jail for was malicious interference to the local police in his area. This obviously did not teach him his lesson. We understand that he caused a great amount of interference to the Sacramento County and Roseville emergency/public services communications and often identified himself on those malicious transmissions as "The Phantom Jammer". We were told the charge Seaside Police brought against him was "Interference of a police officer in line of duties".

Note: It is an unfortunate coincidence that the malicious interferer used the name "Phantom Jammer". He has absolutely NO association with or relation to PARG (Phantom's Amateur Radio Group), the group which located him & turned the necessary information into the Seaside Police which led to his arrest for the interference. We did not release this information until now at the request of the local law enforcement officials to prevent tainting their investigation.

This was PARG's second year in a row of providing public services during the Seaside Ham Convention. Last year several PARG members apprehended a purse thief (after a brief foot pursuit), returned the purse to the rightful owner, and detained the suspect until police could arrive. PARG also performed crowd control activities at this time due to the large number of people who stopped to watch the purse thief incident.

PARG is the Phantom's Amateur Radio Group in Portland, OR and is Portland's most active VE testing, repeater club, emergency communications, and ham radio group. Please visit our web page at
"http://www.teleport.com/~mscott/dumb.shtml".

From: kb2rmi@pop3.frontiernet.com
Message-ID: <4qnfie$s3c@cheatum.frontiernet.net>
Source record: 199150

I want to buy a dual band mobile, however it seem that there are a lot of variables. Alinco sells the new 605 for what other used rigs asking prices are, and I am sort of confused by the different features in the Icom lineup (2350 vs.2340, etc.), so I am asking for opinions on what you find desirable with your rig, as well as dislikes and needless features, intermod problems, etc.. I have a DJ580T and like Alinco but am not a big HT user, so it sits in the drawer most of the time. I am kind of gravitating to the Alinco and Icom line, but would like to hear some Kenwood opinions as well.
Also, if you have a dual bander that you want to sell, let me know.

>rig? This is the battery that retains the memory. It is not obvious from the
>schematics or looking inside the rig.

Take the top off, remove two screws and the IF board will hinge up. Under
there is the microprocessor stuff. 80C49 uP and 8043 parallel ports.
Its somewhere around them. Doesn't do much except hold onto the 6 memories
when the power is gone. Not like them Icums where the radio turns into a
doorstop when the battery dies.

See? There is something nice about a Kenwood. Mask ROM uP's.

Hi,
Just came back from a holiday on the weekend, and picked up a
Hallicrafters TW2000 1950s vintage portable at a small town antique shop.
Just couldn't resist. Pretty good condition, checked over and re-tubed by
a local Ham there. Manufactured by Hallicrafters in Canada. Wondering
about info on this one. What is it worth, the history, availability of
manuals, etc. Anything will help.
Thanks,
Chris VE6RDC

Does providing communications on 2meters for a search and rescue operation for a little girl that was abducted seem self centered?? The volunteer fire dept was there. However the 900 MHz system that the city was using would not work in valleys. The city officials were only carring excess bagage. Their radios could not communicate. The hams could. The hams were asked to provide help with communications because the "official" comm system would not work.

This does not sound self centered to me. It sound like saving the bacon for thr city.

prvalko (prvalko@vela.acs.oakland.edu) wrote:
: Hi!

: I just discovered my FT-900 has developed a curious "white noise" in the
: receiver!

Here's a follow up.

I called Yaesu (Did you know they pronounce it - Ya Hey Sue?) and the
tech support was next to worthless. I think it's just a clerk with a
book of modification notes. I guess I've been spoiled by Ten Tec.

Anyway... I have my FT-900 torn apart on the bench and have been probing
around the LO circuits. This thing has FOUR local oscillators and the
CPU picks which one to use depending on the dial frequency. I am thinking that
one of the LO is running when it's not supposed to be and that's what
causes the white noise. There is an IC that does BCD/decimal
decoding and it may be what's causing the trouble. Pretty hard to work
on a rig without voltage charts!

I've gotta call Yahaysue tmw and order the freaking service manual.

Source record: 199156

I had the 508 for a week. I loved it, but took it back for FT-50. I
really needed the touch tones and didn't want to also carry around a
dialer. I got the 508 as a LITTLE scanner to carry around and not also
have to take around the dual-bander. The Yaesu is about twice the size
but has many more options - so it's much more of a radio - in a different
class than the 508. The FT-50 is small but dosen't make it in the breast
pocket, just a little too heavy. The net has a few good referance points
for the Yaesu FT-50 through it in your favorite search engine. I only
had enough $ for one radio so the Yaesu won out - but I do plan to get a
508 when I'm able to sell something. I really long for that tiny little
scanner next to my heart!

Hi Folks,

I am considering the purchase of this 2M mobile radio, and I would appreciate any input on it from current owners. Good choice? Bad choice?

My usage for the unit would be 85% fixed station packet, and 15% casual mobile (eg. tossed into the car).

I would expecially like to know if anyone has used the radio for 9600 baud packet, as Alinco claims is possible. I run 1200 right now, but intend to upgrade in the future.

Thanks and 73's,

Rich

Brian Rademacher <N0XLF@ix.netcom.com> shared the following priceless pearls of wisdom:

->Is is possible to get amateur radio equipment type certified for
->commercial use, or does the equipment actually have to be built for
such
->a purpose?

Well...like every other question, it depends. The absolute answer is yes. There are ways to do it. However, there are caveats.

1. Let's say you have a piece of Kencom amateur radio 2-meter gear, a KC-1234 that you want to have type "certified" in the commercial 150-170 MHz. range. The actual approvals are type accepted for the transmitter and certified for the receiver (2 separate approvals required) but let's not stand on splitting definitions right now.

2. You can't just ask for a Kencom KC-1234 type certification. You have to make up your own name (and Kencom is certainly going to sue you if you use theirs) and your own model number. You have to rip off the Kencom nameplate (and for legal reasons, I'd suggest that you sand off the faceplate logo too).

3. Then you put what is now YOUR radio of YOUR manufacture through the type acceptance test procedures, prove that the radio will meet the commercial specs, and submit the data along with the fees to the FCC labs for their perusal. The tests ain't easy and the fees ain't cheap. Unless you've got your own lab set up (see the 1984 RF Expo proceedings for a paper I wrote on TA tests on a string -- "Champagne measurements on a beer budget") figure between $5k and $10k for the tests and another $1k or so for the fees.

4. If and when you get the approvals back, you slap YOUR label on YOUR radio and send it out. If, by the way, the radio was one that had a frequency selection feature, you are somehow going to have to disable the front-panel use of that feature. You can still TA the radio with the circuitry, but the operator CANNOT have a control that would allow them to transmit on a channel for which they weren't licensed.

5. And, of course, unless you've got a deal going with Kencom, as soon as they find out you are pirating their radios and selling them under your brand, you are going to play hell buying them.

My Cental Electronics 10A...by far the most popular amateur SSB rig of it's day... used a 9 MHz SSB generator, and a 5-5.5 MHZ Command set VFO. With the SSB switch in normal, it was LSB on 75 and USB on 20.

Looking back in my logbook, I see most other contacts were with similar CE rigs.

9 MHz was the most common crystal filter and phasing rig IF frequency, and so VFO's were commonly on 5.5 MHz with mixers for other bands.

I'm not quite sure if this is the proper group to post this in, but here goes anyway.

Out local amatuer radio club was donated a World War II vintage aircraft transceiver but we have absolutely no technical information on it.

It bears the model number R1155A and has an insignia below the model number consisting of am "A" and "M" seperated by the symbol of a crown. It's was a 5 band transceiver but is missing the transmitter module.

If anyone has any information about this beauty, please let me know. If there is a more apropriate news group that I should post this in, please also let me know.

Thanks in advance.

4706. Yaesu's Position on FT-50 Problems

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-26 00:00:00 UTC
From: dddavis@atl.mindspring.com
Message-ID: <4qq2pq$1esi@mule1.mindspring.com>
Source record: 198832

I spoke to Yaesu today regarding the following problems with the FT-50R.

1. Wide FM receive does not work.

2. Voice message paging system with FTT-12 does not work.

3. Paging answer-back does not work IF the merson paging talks for more than about 2 seconds.

Note that all of these features are described in their manual and their sales literature. Also, Yaesu tech. support has verified each problem and agrees they exist.

Now the bad part: Yaesu in Japan has said they do not intend to fix ANY of these problems. In fact, they say, these are not defects in the radio, but in the manual and the sales literature. (I never really expected them to fix the wide FM thing, but I did expect a corrected FTT-12). I asked customer service if they would be refunding the money, and the response was " not us, call your dealer". This will be tough for those who bought the radio a few months ago in anticipation of the FTT-12 being available.

Future Yaesu buyers, beware. Once a reputation is lost, what is left?

In article <4qpb1g$8lt@news4.digex.net>,
bnr <bnr@universe.digex.net> asked about the new Yaesu FT50R
dual band HT:

>.... I'd like a dual band and as
>a long time scanner nut, I like the FT50R extended RX.
>
>What I am wondering is does anyone have any
>comments on this radio. ... What kind of accessories are useful?...

Brian,

Seems we are both "long time scanner nuts" and I've been
a ham for 31 years.

Bought an FT50R a few weeks ago and I recommend it
unless you have big hands and have trouble with small keypads.

I bought the 5 watt battery but would buy the 2 watt
battery if I had it to do over. The 2 watt battery is
lighter and thinner and I don't need the extra power.

Bought these accessories, too:

-rubber protector (I forgot what it's called)
-NC50, the 1 hour rapid charger (I'm impatient and don't
want to wait 16 hours to recharge. Therefore
I always buy a rapid charger when I buy an HT even
though it's expensive)
-appropriate sleeve so battery fits in charger
-FTT12 keypad/CTCSS decoder/voice recorder/digital framus
I only bought it for the CTCSS decoder capability

-alkaline battery case
-soft case (I don't use it and am disappointed in it)
-external speaker/mike adaptor so I can use an old fashioned
earphone with the FT50R which has a weird jack

Good luck.

Then she shows the same extreme stupidity that you do every time
you post here (no doubt, inherited).

There are many hobbies I consider stupid and a waste of time.
Since I don't like them, I don't waste my time pursuing them, and
I don't waste my time (and that of the fans of those hobbies) by
going onto their newsgroups and berating them for their choice of hobbies.
I don't miss them and I'm sure they don't miss me.

Since you seem to hate ham radio so much, if you were very intelligent
you would have long since realized that your time would be better spent
finding other pursuits you DO enjoy and spending your time on them, rather
than engaging in petty sniping and berating those people who like
ham radio.
You act as though you wouldn't miss us, and I assure you that we
wouldn't miss you (well, maybe a little bit... like one misses a
tooth ache after its gone). It'll be a "win-win" situation for
all of us.

Around here there are well over 20,000 newsgroups. Certainly
EVEN YOU could find one or two that you would like.

>into the same catagory as you do ? I honestly think that a very small
>percentage of hams participate in any type of public service activity.

In almost every group, 20% of the people do 80% of the work.
I have done quite a bit of public service work, technical training and
some technical experiementation, and I know quite a few other hams who
have done a LOT of public service work and done more in the other
areas than I have. But I know many hams who don't do much (if any)
work in these areas.
This ratio also is correct in professional groups, church groups,
civic groups... almost any group. Hams are no exception.

>In our local community here, that percentage is zero. Of the hams I
>know in the U.S., none pass traffic, none do phone patches, and none
>participate in any communications support activities for the public.

Perhaps you should introduce yourself to a new group of people (and
hams).

>If I see a traffic accident or someone broken down on the road, I
>call it in too, on my cellular phone. I will admit that I attended a
>few marathons here a few years back when hams were supposed to
>be providing communications support, but the activity was such a
>disorganized mess, that I and a bunch of other hams felt we were
>wasting our time standing on a street corner with an HT. So of all

Perhaps you could make a major contribution by helping organize
this activity.

>To me ham radio is just a hobby. I don't feel at all committed or
>obligated to anyone, as I passed the test to get a license and I
>paid for all my own equipment. I'm sure there are lots of hams who

Then you are resting on the laurels of those who do provide
emergency comms, public service, technical advancement, etc.
As you say, there are many other hams who feel as you do.
However, if you look at the regs, it's the technical and service
aspects of the hobby that justifies its existence.
Fortunately, there have been enough hams (so far) that *will* do
the work so we continue to deserve that justification.
One of the reasons I work in ham radio public service events, etc. is
that my parents raised me not to be a free-loader.

>If the FCC asked me tommorrow to answer one question,
>'What have you done to justify the existance of Amateur Radio' ?,
>I honestly would have to answer 'Nothing'. Unless passing out

Fortunately, I wouldn't have the answer "nothing". Many have done
more than I have, but I've at least pulled my weight within the
hobby and society.
Of course, your activities are the domain of your conscience and your
sense of duty (or lack thereof). To each his own, but we all will
suffer or enjoy the consequences.

Here's another perspective on the 220 grab. Have you heard of Operation Green Merchant? It was IMHO a very unconstitution action by your and my tax funded DEA. A very legal Magazine called High Times carried advertisements for outlets that carried very legal equipment for indoor growing. Lights, watering systems, etc. The UPS agreed to give the DEA the names/addresses of people who ordered products from those stores (delivered by UPS). Remember, a legal transaction, legal products. The DEA used that information to go "visiting" and from here the stories vary but the general theme was a lot of unconstitutional intimidation/harassment/searches.

A lot of tax payers money spent, little result, many rights trampled. About that time UPS asked for those 220 frequencies. Seems like kind of a tit for tat doesn't it?

The FCC was going to quietly turn them over but once the word was out, and a light was shinning on the whole operation, they had to do it the legal way; ie, put the freq. up for bid. The rest is history.

>But both are bottom of
>the barrel methods compared to Clover, PACTOR, etc.

Hi Gary,

It may well be so in theory,

But if I listen on the band, I always wonder why digital stations
are putting out extremely strong signals. OTOH, If someone set
aside 50 KHz for Pactor or clover, and this section got as busy
as a typical CW section, you can bet that the effective throughput
will be very low, because the stations will spend most of their
time sorting protocols, syncronizing et.c.

Is is possible to get amateur radio equipment type certified for commercial use, or does the equipment actually have to be built for such a purpose?

I heard a while back that if the equipment met certain guidelines for for transmitting deviance, etc., that it could be type certified for commercial use...

Hi Joe, I experienced the same problems with my 706 as you describe with stock mic. I changed to the SM6(ICOM) for fixed station operation, Mic gain at 6, and carrier point at -140 and now get good audio reports. On mobile I pickup an old Icom HM=14 and get good audio reports also. I tried everthing with the stock mic, I even put toilet paper inside to baffle it , did all the mod like remove the metal plate etc, to no avail. Try an SM6 and see if you get better results.

If the users' controls allow the entry of arbitrary transmission
frequencies, then the radio will be unable to pass approval for use
in other civilian land and air services licensed by the FCC. The
setting of transmitter frequencies at any point within an assigned
band, unlike the choice from a limited number of assigned channels,
is a uniquely amateur privilege, and one which is earned by license
examination testing.

>Well, fill me in. What's your objection to Yaesu...nationalistic?

Nope, nobody here makes radios, and the big three are all made
in the same nation. Icom's HF receivers are far superior to Kenwoods,
that's why all the big contesters use Kenwood. The deader your
receiver, the less you hear the guy's transmitter who is sitting
next to you. Yaesu has had problems ever since the invention of
the transistor - they made fairly good stuff when we all used tubes,
but since then they have gone down hill dramatically. And Yaesu's
target market has always been 11 meters. After the 101's they
took 11 off the bandswitch, but they replaced it with a dipswitch
inside the radio, I guess so nobody would cut the wrong wire.....

I did see a Icom 706 (?) at field day last weekend, and I wasn't real
impressed with the receiver (HF) on it, it has the image problem on
CW that the 745 had. But it's a whole lot of bands for not a whole lot
of money, so it still looks like a good deal to me.

My observations are not based on labratory testing (Gary can fill you
in on that), just real world use. After having owned radios from all
of the big three, and having watched all the guys I started out with
do the same, seems like most if not all of us wound up with boxes
that say Icom on the front. In the last ten years I've also met a
lot of Japanese hams, and most I've met prefer Icom also.

I only have one piece of Ten-Tec equipment, that's a Titan amplifier.
It's probably the best piece of ham gear I have ever owned. I bought
it on the recommendation of another ham who has one, and some

other friends bought them after I did. None of us have been sorry we did buy them. Ten-Tec's service is miles above anyone elses. I've had a few minor problems, and Ten-Tec has responded immediatly to resolve them, no questions asked. I've personally witnessed a lot of RF amplifiers go up in smoke, but none have ever said Ten-Tec on the front. If I ever have to buy another amp, it's the only one I would consider. Ten-Tec amps aren't cheap, but when you buy an amplifier, the last thing you want is a cheap one.

There's a pleasant mathematical coincidence, but the original Collins
filters were developed at 9.00 MHz and the Collins PTO ran from 5.0 to 5.5
MHz. Using the same math, 9-5.x put you on 75M LSB and 9+5.x put you on
20M USB. Remember that 40 (or 39M to be precise) was then and continues
to this day to be primarily a shortwave broadcast band, all amateur
complaints notwithstanding.

Oh no, the songspiration is upon me:

Ole Morse Code Is Here to Stay

Ole Morse Code is here to stay,
It will never die.
It was meant to be that way
Though I don't know why,
I don't care what no-code Techs say,
Ole Morse Code is here to stay.

Ole Morse Code is here to stay,
We'll dig it to the end.
It'll go down in history,
Just you watch my friend.
Old Morse Code will always be,
It'll go down in history.

Repeat first verse.

Sung to the melody of "Rock N Roll Is Here To Stay" as sung
by Danny and the Juniors.

Adapted by Curt KD4YU, an EXTRA class ham. :-)

The R1155 is an Rx, not a Tx/Rx. There was a companion Tx (not a module)
called the T1154, and the two were generally used connected together.
They were designed and built in the UK during the war, and were used in
British bombers.

The R1155 was quite popular with UK radio amateurs and SWLs when I was a
kid in the 50s, as lots of them became available quite cheaply, and most
people were using AM rather than SSB. I think the A and M with a crown
denotes "Air Ministry". I think that Practical Wireless magazine had an
article on the 1155 a few years ago, with details on refurbishing the
thing. You might be able to get the relevant back issue from the
publisher.

Curtis, I will agree "setting" one up is no big deal, however try to make
one actually useful..add an enet card to the exisiting modem, SB32, VGA card
typical config and do it such that 5 or 6 different programs ALL work, I think
you would be suprised how poorly they perform, without reload, reboot, reconfig
etc... Better yet try and run some of the more "powerful" software and see
how quickly it comes to it's knees..

> ready to be used, even though they are preinstalls.

Not to change the subject but after spending the last 5 years in "higher"
ed (colleges), I think some folks are better off flipping burgers, as they
have little ability to survive inthe real world. They are being taught
archaic things, not basics mind you, which they could use, but useless
stuff because faculty doesn't want to budge and learn soemthing new or better.
There ar exceptions, but for the most part, CS people are graduating without
ever looking into a PC or understanding the basics...like EE's used to learn.
I agree some stuff is being rushed to market, but that is what the public
wants or will settle for.

Stuff Deleted
Once the net-newness wears off, which it will, because it willnot and cannot

be everything we want it to be, without a cost that no one wants to bear, computers may go back to being auseful tool, not some status bar for all to belly around to....every needs a whiz bang pentium to surf with like they need a hole in the head....how about some truly fast IO, and don't give me the ATM crap..it'll be years before it is practical if then

Sure, if it meets the technical requirements for the rules part you are
applying for type acceptance in then it would do just fine. However, one
of the biggest problems you would run into with Part 90 type acceptance is
the fact that amateur gear is programable from the front panel. Part 90
does not allow the end user to have access to programming of the radio.

Swtich from coax to twin lead. You can buy ladder line from ham shop
or just use TV antenna twin lead wire. Feed it into your balance line
input to the tuner.

I had the same type of problems with SWR till I did this on my dipole.

30wpm for typing is lame, 30wpm for copying code is exceptional.
Bad comparison.

1200 baud packet facts:
1200/11 = 109 bytes per second potential
109/5 = 21 words per second potential
21*60 = 1260 wpm potential
^^^^^^^^
Facts:
World record typist - 120wpm
World record CW copy - 76wpm

My guestimation below:
Average typist - 40wpm
Average CW copy - 15wpm

4759. Yaesu FT-8000

4760. Just got a Timewave 599zx

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-27 00:00:00 UTC
From: dsnider@access.digex.net
Message-ID: <31d1ff50.3292296@newsreader.digex.net>
Source record: 198778

I received my Timewave 599zx in the mail today. I've had it on order since last November.

My initial impression is that this DSP is fantastic. So far it really meets my expectations for this rig.

I tried it on CW and had a clear signal down to a 10hz bandwidth. The random noise reducer really knocked out the background noise.

I tested it on 40 meter SSB and was able to tune in a conversation only 2 khz away from a shortwave outlet. The tone remover completely eliminated the heterodyne. Then I adjusted the low and high cutoff frequencies until the chatter from the outlet station nearly dissapeared.

On Sw, I tuned in a station on the crowded 49M band and used the bandpass filter to remove heterodynes with a bandpass of 100-4850. The wide bandpass sounded great.

I've only used it a couple hours so far. I love being able to create my own 10hz - 5000hz bandwidth filter by just turning a couple knobs. The tone remover and noise reduction appear to work well. There are many more features I haven't investigated so let me get back to playing around with this amazing DSP.

Tom:

Although I replied to your query by private e-mail, I feel I should post part of it for everyone's "benefit" ?! (and maybe get a few other TS-870S owners to comment).

The CW QSK on the TS-870S is NOT silent, ala Ten-Tec. You would think that such a sophisticated radio would at least match Ten-Tec and provide state-of-the-art QSK, but not so. There is a light clicking sound that emanates from inside the rig when keying using QSK, reminiscent of a reed relay. Apparently, it CANNOT be defeated using the menu. Be forewarned to look elsewhere if silent QSK is mandatory. Otherwise, IMO, the rig is superb.

World band radio generally refers to shortwave broadcasts. You can certainly receive broadcasts from foriegn countries but it has nothing to do with satellites. A decent shortwave broadcast receiver will cost at least $250 to $350. Get something with digital tuning, minimum 1 KHz steps and full coverage from 0.5 to 30 MHz. Good luck.

Keep in mind that all TenTecs use reed relays too. They are fairly quite
but you can hear a slight clicking if you put your ear next to the rig.
Maybe the 870's relay just needs a little padding.

Source record: 198791

For your information, a non-memory iambic keyer and Bencher paddles
and a straight key were used. I have setup the CW station for
three out of the last 5 Pinellas County Field Day outings. I hadn't
done much HF during the past year because of lack of time, but
was pleasantly surprised how fast I got back in the swing and was
able to copy the fast stations. It took a little longer to send
that fast. These outings keep reminding me how much I love CW.
For a real blast, try it mobile with a straight key held to your
leg with velcro. I think I love code because it's a challenge -
any nitwit can talk into a microphone ... then again, some of them
can't.

4776. TS-850 Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-27 00:00:00 UTC
From: Scott Ellington <sellington@ssec.wisc.edu>
Message-ID: <31D2944C.31D6@ssec.wisc.edu>
Source record: 198794

My friend W9IXG seems to have no end of woes with his TS-850. The latest is a display that blanks while tuning, then comes back when he stops. The radio otherwise seems to function fine, but he can't tell what frequency it's on until he stops tuning. Has anyone else seen a problem like this?

Also, does anyone know if there is a Kenwood reflector?

Thanks and 73,

Scott K9MA

>
> 73, Dick - K5QY --- These opinions are my own, not my employer.

I hope it receives phase noise - if it doesn't it won't receive anything
else either!! The fault there is in your neighbor's rig which radiates
excessive spurious signals. It's not (necessarily) in the FT1000 receiver
which hears the crud along with the desired signals on frequency.
And FWIW, if hams insist on buying a general coverage transceiver, don't
expect much filtering of the phase noise and other crud. It's not like
the old days when rigs only had to pass a few 500 kHz segments and could
reject everything else that came out of the VFO.

>inside the radio, I guess so nobody would cut the wrong wire.....

I suspect you'll get a lot of argument about your comments above.
Though I own Icom HF equipment, an IC-735 and an IC-706, I must say
that Icom is in second place for HF transceivers compared to the
newer Yaesus. At the top of the line, the FT-1000 simply blows
Icom and Kenwoood away, and the FT-990 and FT-900 aren't bad in
their price classes either. Kenwood HF gear is also pretty good,
if you can keep it working. The big problem with all the recent
Kenwood gear is reliability. (And their VHF/UHF gear has always
sucked.)

>I did see a Icom 706 (?) at field day last weekend, and I wasn't real
>impressed with the receiver (HF) on it, it has the image problem on
>CW that the 745 had. But it's a whole lot of bands for not a whole lot
>of money, so it still looks like a good deal to me.

It is a good deal, for what it is. It is not a top of the line rig,
though I must take issue with comparing it to the IC-745. Now that
was a truly awful radio. It suffered even more from front end overload
(all the time) than the IC-706 does when the IC-706 preamp is on (you
should leave the preamp off on HF, you never need it). The IC-706 does
let you reverse sidebands in CW mode, which does get rid of most problems.
There is a bit of filter blowby (I assume the rig you saw was fitted with
the optional CW filter, without it the IC-706 is totally unsuitable for
CW or digital), but it isn't nearly as bad as the old IC-745. That thing
was a real turkey. The IC-706 isn't as good as the IC-735, but then few
radios are (and all of those are lots bigger and cost lots more), and

the IC-706 is smaller still, and does offer 6m and 2m.

>My observations are not based on labratory testing (Gary can fill you
>in on that), just real world use. After having owned radios from all
>of the big three, and having watched all the guys I started out with
>do the same, seems like most if not all of us wound up with boxes
>that say Icom on the front. In the last ten years I've also met a
>lot of Japanese hams, and most I've met prefer Icom also.

Like I mentioned, I've got two Icom radios now, but I've owned
Kenwood, Yaesu, Ten-Tec, Drake, National, Hallicrafters, Heath,
SBE, Galaxy, Johnson, B&W, Collins, etc over the years. The Icom
radios aren't the absolute best in raw performance. Of all those
I mentioned, the FT-1000 is the best in raw performance. But there
are more issues than that for me. I want a small radio today, and
I want one that is well built mechanically and thermally. In the
small radio class, that's Icom.

But if I were fielding a big contest station, all the radios would
likely say Yaesu on the front. Though if I could keep them running,
they might say Ten-Tec (you *need* that great factory support). They
would not say Kenwood unless I had at least four sets of spare radios.
That way maybe I'd have one radio that worked when I needed it.

Brian,

I am new HAM myself. I just got my license 2 months ago. I made the decision to buy the Yaesu FT-50 for my first FT. For a beginner and a no brainer when it comes to radio and communications, the FT-50 came through for me. I LOVE IT!!! It works great. I did not have a hard time at all figuring out what it can do. Even though I am not all that familiar with terminologies, I manage to figure out what they are and how they work.

The size is perfect me. 5 WATTS definitely. This will give you the flexibility of transmitting on low power to extend battery life and high power when you really need it. And boy am I glad I could switch to 5 watts. One accessory that I would recomend that you get right away is the Mic adaptor, CT-30. The FT-50 comes with a unique mic/ear jack plug, there is only one. Both mic and ear plug into the same jack. Yaesu have accesories that will work with it but if you want to use standard accessories, ones with two prongs on them, you will need the adapter. Anyway, I may not be the best source for comments on the FT-50, but from a beginner's stand point, I give it my highest recomendations. There is a great review writen by another FT-50 user in the Ham Radio Online Magazine, http://www.accessone.com/~vbook/hronline.htm. I suggest you read it.

In theory, you can gain Type Acceptance for any radio which meets the Type Acceptance criteria. In practice, unless you are the manufacturer or importer, it would be extremely difficult. And obtaining Type Acceptance is both expensive and time consuming.

Most amateur equipment does not meet Type Acceptance criteria in one or another important way. The most likely way it will fail is in having user programable channels. Land Mobile Type Acceptance doesn't allow direct frequency entry by the user.

Most amateur equipment can probably meet the spectral response requirements and the frequency tolerance requirements, but that's only part of what makes a radio Type Acceptable in the Land Mobile service. It also has to be idiot (user) proof as well.

Kraco, Audiovox, Kenwood, Sony, etc all have 30-50 watt amplifiers
available for auto use. Any car stereo shop should be able to
show you a selection of such amplifiers, and the speakers you'd
want to use with them. The cost shouldn't be much over $100
installed (less speakers). Though I must admit I have no idea
why anyone would need that much audio out of a scanner. It won't
be stereo, and fidelity will suck.

Brian Rademacher <N0XLF@ix.netcom.com> shared the following priceless
pearls of wisdom:

->Very interesting, but I think I'll pass :) Sounds somewhat expensive

Well..of COURSE it is. The TA rules were set up for manufacture, not
one-off conversions.

- Now
->here is where I get in to the interesting part on my end...I suppose
that I
->could justify my cause in the following way (if it ever came down to
it)...I
->work for a law enforcement agency

Then you KNOW the answer, don't you??

and have a plethora of frequencies
->programmed in to my Icom D-100, with the capability to transmit on
all of
->them...Now I know that there is the rule of "if in case of an
->emergency....anything goes...."... Technically, you could say that
anything
->that I would ever have to communicate over that radio (which is in
my
->personal vehicle)

Then it is not even a law enforcement issue. It is a private citizen
who becomes a law enforcement officer when officially assigned to a
duty. An off duty officer has no more right to break the law in the
advancement of "law enforcement" than I do.

could be classified as an emergency...Wonder if that would
->fly? I've always wondered...

Are you willing to sit on the left side of the courtroom with the AG
on the right side and plead your case???

Tim,

You might have heard about the World Radio Network (think) they basically
take the best of shortwave radio programmes and relay them via
satellite audio links. to receive you'd need a dish and tunable
decoder for the various audio sub-carriers.

Not quite as portable as a sony SW100!

>fly? I've always wondered...

Nope...Don't think it would fly. The rules that allow you to break the
other rules in an "emergency" are for extenuating circumstances. If you
are a law enforcement officer, handling emergencies is hardly
extenuating since you do it on the job everyday, right. These would be
"regular communications".

Your "cop radios" operate under part 90. Part 90 allows for the
temporary use of non type accepted equipment under certain conditions -
For example, when ordinary equipment is not available and
communictaions are needed for disaster recovery. However even when you
do that, you must notify the FCC (within a reasonable time frame) and
they can order you to cease such operation.

I have nothing against "moding" a ham radio to work outside of the ham
bands because there are legal uses for it. However - this ain't one of
them.

I've been pleased with the V8600 Speech Synthesizer from RC Systems (1609 England Avenue, Everett, WA 98203, telephone (206) 355-3800). It requires +5V power, a speaker, and an interface to RS-232 serial (a transistor and resistor) if desired. It has built-in software (firmware, actually) that converts text to speech but can also do other things, such as generate DTMF. Hours-and-hours of fun for hams of all ages for ~$150.

Note that this is not an endorsement by the organization in my e-mail address; this is K7JD speaking.

>now! 73

I don't understand this. I found that the default value on mine was zero and that setting it anywhere from 100-200 improved my transmitted audio considerably. It was reported that I went from 'a runt with a clothespin on his nose in the bottom of a 50 gallon barrel', to my natural self, however that may be described. The control seems to go from 200 to -200. I don't run LSB anymore so I'm not sure if you have to set a minus value for that. The IF shift needs to be set the other way to get the equivalent receive audio correction. For USB I have my carrier shift at 100 and my IF shift on the first red line to the right of middle.

A good way to check your audio is on the Russian bird, RS-12. Transmit up on the 15 meter band and listen to yourself on mode T using headphones and a 2 meter SSB rig. Or else use another SW radio on 10 meters to listen with but its not as strong and clear.

Satellite: RS-12 NASA Catalog Number: 21089
Analog Transponders:
Uplink Downlink
Mode K: 21.210 - 21.250 Mhz 29.410 MHz - 29.450 MHz
Mode T: 21.210 - 21.250 MHz 145.910 MHz - 145.950 MHz
Mode A: 145.910 - 145.950 Mhz 29.410 MHz - 29.450 MHz

Mode KT: 21 MHz uplink into 29 and 145 MHz downlinks
Mode KA: 21 MHz and 145 MHz uplinks into a common 29 MHz downlink

Beacons: 29.408 MHz, 29.454 MHz, 145.912 MHz, 145.958 MHz

Robot Upinks: 21.130 MHz, 145.830 MHz

Gary Coffman (gary@ke4zv.atl.ga.us) wrote:

: Now, on a smooth Earth, you need an antenna about 1,000
: feet HAAT (Height Above Average Terrain) to have a LOS
: distance of 30 miles (that's because the Earth is not
: flat and its curvature sets a finite horizon). If both
: ends are elevated, however, you can divide the required
: antenna heights between you. In other words, the HAAT
: can be gotten by a single 1000 foot elevation or by two
: 500 foot hills, one at each end. If the Earth is not
: smooth between the two points (the usual case), you'll
: need more height at the end points to achieve LOS.

I was looking at this, and since the line of sight distance goes up approximately as the square root of the height above ground (good approximation for relatively low heights), increasing the tower height 4X only doubles the LOS distance. From that it follows that dividing the tower height by 4 only halves the LOS distance. Since the original distance covered by a 1000ft tower (more like 39 miles by my calculations) can be just covered by two segments of 19.5 miles, it further follows that a 250 foot tower on each end would equal a 1000 foot tower on one end and a "short" antenna height on the other. Interesting. Ideal line of sight situations, of course.

Of course, in "real world" situations, and especially in the mountains just west of where I live, propagation can/will be quite a bit different...which is what makes it interesting.

I don't remember seeing anything in the FD rules that specifies that
code must be sent by hand and received by ear. If there's no rule
against it, it isn't cheating. Perhaps you'd like to cite the relevant
FD rule?

Anyway, the bit about not having a brain.... that's just a gratuitous
flame. I'm sure that people that haven't learned code yet will be
really inspired by that.

>Dana Rodakis, AJ1R
>CW Station Coordinator
>Pinellas County Field Day

>copy code, not some electronic decoder.

Well, good for you - I use my brain to decode CW also. I'll bet someone
trying to use a machine to decode CW isn't able to work as many stations
as one of us is - the electronic decoders are often pretty fussy and
apparently don't do all that well on a congested frequency. In other
words, the people using a decoder may be at a disadvantage.

Dana

It should not be at all difficult. Honest.

What sort of antenna tuner? (Not that you need it for this antenna)

> Here is what I am trying to do: to build a 1/2 wave
>diapole for the 28-29 mhz. I splice the coax, solder one end to a length
>of wire 8.2 feet and the other braided end to a length of wire the same

Half Wave Doublet Antenna
I assume it looks sort of this way:

```
- - - O-------------------------*O*--------------------------O - - -
```

8.2 ft 8.2 ft

- - - is rope, nylon rope, string, or other nonconductive support

O is insulator (three shown)

* is where coax hooks up (one the same end of the coax, connect
the braid to one side and the center conductor to the other)

What sort of coax do you have? Make sure its RF cable and not just
shielded wire. 50 ohm is what is most often used, but 72 ohm will
work fine.

Connect the VSWR bridge at the other end of the coax.

>I suspend both ends using insulated clamps between two tree's,

Are you sure the clamps are really insulated?

If you have an ohmmeter, check that the coax measures open with the
antenna connected. That way you know the coax isn't shorted.

>making sure that the whole antenna is parallel to the ground and it's 8
>feet above the ground.

You will probably get much better results with it higher above the
ground. GET THOSE AMPS IN THE AIR!. Don't worry about it being

parallel to the ground or at any special height above the surface of the Earth. Having said that, I still can't believe your SWR is so high, even at eight feet..

>Now when I check the SWR, it's unbelieveable. Like
>I have said before, I have used different wire, different coax (the
>standard coax, just different brands). What am I doing wrong ?

Not much. How do you check VSWR? A little current on the coax that is induced from the antenna can make it look as if the VSWR is high. Some lengths of coax are more likely to do this than others. One way to check is to make a tight coil of coax (three turns) near the feed point and see if the SWR changes (or use a balun).

>Can anyone
> spot my mistake ?

Does your transmitter work OK into a 50 ohm RF load? Are you sure the bandswitch didn't slip and you are trying to feed the antenna with 14 MHz instead of 28 MHz?

I once tried to tune an antenna with a vector impedance meter and found that the antenna picked up signals that caused false readings. I assume you are using some sort of transmitter.

If the antenna is only 8 feet high, you can probably take it to a friends house and use his radio to check it, etc. Once you get a VSWR below 3, you can see which frequencies are lower and adjust the length until it is quite low.

Let me know what you find, I'm sure I can help you get it working.

I've worked 48 states and many countrys on my 50 MHz dipole, mounted in my attic, and never did check the VSWR yet.

Good Luck

John, W0GN

4800. What's good price for TH-215 HT?

Source record: 198742

Help! I bought a used FT-23. It worked fined, until I dropped
it on the asphalt. The battery broke open and shorted (grey smoke).
When I checked the battery, it had obviously been rigged.
Scotch tape, Sanyo Nicads and several very bad solders.

I need a hint at a schematic for the battery FNB-10, so that I
can put it back together.

I really like the FT-23, and I'd appreciate any help putting
it back in service.

Perhaps you have a dead battery for the 23/33/73 that you can take
apart, or maybe a working battery that you'd like to sell?

Thanks in advance,

Victor KF4BUX Gregg, 404-377-8870 victor.gregg@bstl.bls.com

I ECHO the comments about DIGI DEY one of the BEST sources!
however if you have access to a public library I might also suggest
looking in just about ANY electronics publication from the EARY 70's
CLOCK BUILDING articles seemed to really be invogue in that era.
some used a (then) BRAND NEW clock on a chip, and others were discrete
component types most all had the features and functions you mentioned.
FOR an extra extra large display I built one of the clock on a
chips kits and then added a few extra parts that DRIVES six inch long
flourescent tubes (like in camp lanterns) for each segment - - a CLOCK
with extra bright one foot display is GREAT for a "master" hamfest
clock - or many other GROUP uses.... just an idea....WHY STOP THERE -
have it drive (trigger) standard EIGHT FOOT tubes.... WOW ! just
think - place it on your roof so that people in AIRLINES could see
what time it was at "YOUR" house... I've always wanted to build one of
those just to see HOW FAR away you actually could get - but never ever
followed through with it... (sigh)...
have a good project building session

>you find desirable with your rig, as well as dislikes and needless
>features,<<<

I know that there are as many opinions as there are users of this
group, but here are the FEATURES I look for most.
FIRST and foremost is the ability to function as a CROSS-BAND
repeater. I know you said you do not use your HT much, but perhaps
this is just what is needed to get you using it more. It is so very
convient to park your vehicle in the parking lot (or anywhere) punch a
few buttons and clip your HT to your belt. If you should need to get
in touch with someone (or they with you) you now have your 50 watt
mobile out in the open (more or less) rather than 5 watts at best
inside a building.

The other feature compliments the first and that is the ability to
control fuctions of the mobile from your handheld (POWER
channel/freq.) etc.

I know there are lots of those types that just HAVE to KNOW what is
going on on every machine for a two-hundered mile radius, but for MY
buck, I do not need LOADS of MEMORIES or SCAN features... heck unless
I intentionally GO to a different geographicla area I only need three
or four memories... It IS nice to have grouped memories if you travel
a lot so that you can lock out a whole group (area) easily when not
using them.

remotable radio/faceplate is a good feature with vehicle dashes
getting more and more crowded.

just a few ideas to think about..

Francis, what, prey tell, are 'search and rescue certs' ? Are those,
like, breath mints you eat while you're out in the woods looking for
lost people with your hound dawg, or what ? Do they keep the dawg
from loosing the sent because of your bad breath ?

Just curious. We have regular certs here, and the mint ones, but never
seen search and rescue certs in any of the stores. Course, most of
our rescues here involve the ocean, and it would be hard to eat breath
mints while you were scuba diving, so maybe that's why the never
caught on over here.

>Jim W0oog/5

Yes, I have that excellent book. I also researched old issues of Ham Radio
and have had a lot of email about this, some of which I have included
at the end of this post with permission.
I solved the problem of my IC-706 intermod on 6 meters by
building a single 12" long by 2" wide coaxial cavity filter out of a
surplus dual cavity 170 Mhz setup. Although I measure a 2.5db loss it
completely cured the intermod and has a nice passband about 1 Mhz wide.
While the cavity is a little small for 6 meters, I made up for it with
additional capacitance. I can probably reduce the loss with better internal
connections and by tweaking the pickup loops. For now, I'm okay.
By transmitting through this thing, hopefully I am nicer to the neighbors
as well although I haven't had any complaints yet.

Other ways to cure intermod or front end overload on 6 meters:

What might help that would be a little less ambitious is an OLD
R.L.Drake TV-1000-LP lowpass filter made in the late '60s.
These had a 52 MHz cutoff frequency and lots of attenuation at TV
channel 2. Remember that Drake sold TR-6 transceivers and TC-6
transmitting convertors that made 100W of 6 meter output back then.

The B&W FL6/1500 is designed for low bands & six meters. Its cutoff is
around 54 Mhz,compared to the normal low pass filter which is 30 Mhz.

Another solution is to make a notch filter for 55.25 MHz to lower the
strength of the video carrier. Make one by using a Tee connector in
series with the antenna line. At the third port, connect a small value
capacitor in series with a nearly quarter-wave (@55.25 MHz) piece of
coax (the bigger, the higher the Q) shorted at the far end.
The closer the shorted section is to 1/4 wave and the smaller the
capacitor, the less "coupled" the "suck-out" will be and the narrower
the effective frequency range of the notch. Notch depth is less with
lower coupling, but is a strong function of the unloaded Q of the 1/4
wave line.
The notch resonator will always be less than 1/4 wave. How much less
is a function of how "hard" the resonator is coupled to the line.
Ideally the "small" capacitor would be totally enclosed by the outer
conductor of the coax resonator/Tee-junction combination. Maybe a small

hole in the outer conductor for fine-tuning a variable element.

coffee can helical resonator:
I just plugged the diameter and height of the coffee can into the charts and graphs and picked a close copper tube size for the center conductor. Its tuned with a small (50 pf?) ceramic-inulated variable and the coupling is with little copper tabs as probes. I doubt that it has any advantages over your coaxial cavity whatever except form factor.

... recently found an article out of HR 2/1980 by a friend of mine on converting surplus cavities from Fair Radio. Their # F-238/U is a very nice cavity tunable from 50-58.5. I'm sure they are sold out of the 2M units but these 6M may remain. The surplus series was labeled 417/GRC. As I recall Fair is in Lima OH and still around.

And then there is the coffee can coaxial cavity, which was posted on USENET about 4 years ago. I haven't got it now but would repost if needed.

Have fun,
Jim WA7LDV

Hey, guys, there is a mod floating around to do this, and I think I have
a copy in my files. I've made the mod several times to HR-2510s and it
works well. Contact me if you need a copy of the mod. I think it was
from 73 Magazine a few years back.

>making sure that the whole antenna is parallel to the ground and it's 8
>feet above the ground.

Chris -

I'm not an antenna expert, but I'd look at the following:

1) It's my understanding that if you just attach the center conductor
and shield to the two halves of the antenna directly, your feed line
will become part of the antenna, and it will radiate. Your transmitter
may be looking at an antenna a whole lot longer than just the two
8 foot sections. That would explain the high SWR. Better to get
a balun which has screw connectors for the two antenna pieces, and a
SO-239 connector for your feedline. I think a 1:1 balun would work,
but I could be wrong on that.

2) Height may be part of the problem. 8 feet high isn't much.

3) What do you mean "insulated clamps"? I'd get some insulators and
suspend the antenna by some rope or wire, tying the suspension wire to
one side of the insulator, and the antenna section to the other end of
the insulator. That's the way I've seen dipoles hung before.

4) Parallel to the ground isn't as critical as some of these other
things, I think.

5) Why 28-29 MHZ? The band's dead.

I can't tell you much about the radio without knowing a model number. Look on the back panel for a number that look something like L53xxx3000AM. If you can't find a model number look for a number like TUD1234 on the chassis. Or get the number on the channel elements (something like KXN1234 or TLN1234). Most 1973 vintage equipment was pretty easy to put on 2 meters - just re-crystal and re-tune. You can get crystals from International or Jan to put into the channel elements.

You could use a RF radiation field servey meter that would give you mw/cmsq
The probes used for such meters are so broad banded that you would
have a difficult time determining which frequencies you are measuring.

The only way to get a good feel for the spectrum is with a spectrum analyzer.
You can connect an amplifier to your Yagi if the signals are low level.
You could build a spectrum analizer that would connect up to an o-scope but I
have never seen one that would extend above 1.2 without down conversion.

You would be much better off with a portable spectrum analyzer tektronics makes
a model 492P which retailed for ~ $12K US. Try a rental place or maybe Tucker
will rent/lease one for your measurements. They are on the WWW I don't have
the address handy. Use a search engine.

You would then need to calculate the free space attenuation of the signal level
you recieved and you could determine the approx tx output if you know the
distance from the emitter.

>I think the most important feature is either a "scan" or "seek"
>function, or both. This will allow the radio to tune to strong
>signals whereever you are. In most cases you won't know where to

I agree about the "seek and scan".
There is one other feature that might be considered... the ability to
manually switch to FM mono from FM Stereo. Usually, for quite a ways
after an FM station is too noisy to listen to in the stereo mode, it
will be quite listenable in monophonic or monaural mode. Though most
radios will say that they "automatically" switch from stereo to mono,
in real life the radio will keep switching back and forth with it's in
a fringe area, making the noise problem actualy WORSE.
Twenty years ago I went to special trouble to get a car radio
specifically advertised as a "DX FM", got an amplified antenna for the
car, etc. It wasn't worth it.

Another tip... carry some cassette tapes. Sometimes I just can't get
anything acceptable on the radio, so I punch in a cassette :-).
Having someone to talk to on the ham radio helps also.

> fly? I've always wondered...

Probably not, since those situations are the "business" in which your
employer is regularly and routinely engaged. That is, it's normal message
traffic for the public safety radio services, not subject to any special
consideration as more important than other public safety communications.

One of the local hospitals here tried using that a few years ago to
justify sending in-house paging calls right over the conversations of
another local enterprise on a two-way business channel. According to the
local service shop folks, the hospital was warned after one of the other
channel occupants complained and promptly cited the next time an inspector
was in town checking broadcast stations.

Yep, that makes sense. All those big contesters want "deaf" radios
so they can't ear all of the weaker stations on the band, and on the
last day of the contest all they'll hear is the fellow big-guns they've
already worked.

Have YOU ever worked a contest, Jim? Perhaps not the contesters
you know, but all of the contesters *I* know want sensitive
receivers.

I judge brands on a radio-by-radio basis. I've owned Icom, Kenwood
and Yaesu HF rigs (as well as Drake, Heath, Hallicrafters and an
ATLAS, ARGHHHH!!!!!, you don't know junk, 'til you've owned an
Atlas) and Icom, Kenwood and Yaesu VHF rigs (as well as some
"wet-back", illegal alien-type imported rigs... remember Azden?)

There are good and bad radios in all of the brands.

4827. FT-50 Noisy TX

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-28 00:00:00 UTC
From: David De Coons <rocket@intercall.com>
Message-ID: <01bb653b.5f135940$af194dcf@aa2as>
Source record: 198867

I had a problem with my FT-50R with a crackling noise during tx. I took the radio apart (pretty easy) and found two possible culprits.

One, the screws holding the two PC boards together were loose, possibly causing a poor connection between the boards.

Second, and probably the real problem. They use a spring loaded pin on the center of the chassis mounted SMA connector that contacts a metal tab sticking out of the RF board. The SMA connector is does not flex as it does on the FT-40. I soldered the pin to the tab.

The radio now works without the noise on Tx.

4828. Found ICOM IC-2350H bug. Need Help

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-28 00:00:00 UTC
From: Bill Stewart <stewart@peganet.com>
Message-ID: <31D45F2B.1358@peganet.com>
Source record: 198868

I have found a bug in ICOM's IC-2350H dual band radio.

While transmitting, the subband receive opens up. It comes through the speaker quite plainly, and in fact is heard through the mic while I'm talking, thus re-transmitting whoever is talking on the subband without their knowledge.

Subband mute functions for both bands are on, and they do mute during receive. This problem appears only during transmit.

ICOM does not offer direct technical support. Their web page refers you to your dealer. My dealer says there is no way to solve this problem. I think it is a programming bug, and wonder if the FCC caught this when they gave it type acceptance.

For now, the only way around the problem is to turn the volume down on the subband manually when you decide to rag chew. Then you have to remember to turn it back up when done or you're no longer scanning and listening to the subband and you don't know it. That's a load of horse hockey, and v-e-r-y poor engineering.

Anybody got a suggestion or a mod around this ?

Thanks,
Bill Stewart, N4CRO

Joe,
You might check with AEA and see if they have any left. I designed the
DigiTalker frequency counter at ARE. ARE was bougth by AEA. They never did much
with that product.

Good Luck

uuencoded GIF image of 800 mod for W31A. Not a very good image, but if you are capable of doing the mod, you should be able to figure it out. This mod should not be used on radios used in the US as it enables cell receive and opens up transmit a bunch.

> 73 and thanks in advance...
>
> Wally
> waltm@loa.com

There are two mods I know about:

1) While using the ADMS-1c software to program the radio, pull the programming cord out. This puts the radio in (what I think must be) Japanese mode
remove 800MHz restrictions, and opening up a 222-299 band (which probably doesn't have circuitry behind it). You'll have to reprogram the memories,
and you might have to reset the radio and enable extended RX. Of course in Japan, the ham bands are 144-146 and 430-440 so if you want to *transmit*
here you'll need mod #2:

2) Remove the keypad. Desolder the solder pad labeled "1" (next to "2" and "3", which aren't soldered). This removes TX restrictions. I don't know how
wide it goes, but it turns the light red over the whole range from about 136-200 and 400-499. You also might have to do the resetting thing as above.

Hi Bill. What a pain. I'm glad I read about this before I shelled out
the bucks. It really is no different than my dual band HT, though.

I have a question, though. Why do you feel that the FCC should have
caught this during their type acceptance of it? It is a problem that
affects only convenience, it doesn't make it transmit harmonics out of
band or the like. As I understand type acceptance, it is to ensure that
the radio transmits with legal specs -- i.e. deviation, harmonic
suppression, etc...

> If so, where did you mount the main unit?
>
> Thanks,
>
> KG0GB

Mine hasn't arrived (yet), but here are my thoughts- ('96 laredo)

1. put the main unit back by the spare tire. The full size spare sits at an angle, and it looks like there's close to enough space underneath the spare.

2. with the upgraded sound system, their power amp is sitting in prime territory underneath the left (rear) passenger seat. If I move the jack (from beneath the right passenger seat), I can either put the main unit there, or move the audio p.a. there and put the 706 main unit under the left passenger seat. The jack seems to want to be with the spare.

3. just put the main unit in front of the spare tire, sitting vertically, between the spare and the rear seat (but I've already pulled out the spare once to deliver a refrigerator).

I definitely want to stay away from the front right corner of the passenger compartment- away from the brains.

I think I'm going to end up moving the audio p.a.- I also have an IC-901, which is currently sitting on the floor behind the driver's seat. With the 706, the 6m module becomes somewhat redundant, so the 901 package can get about 1" shorter. Another possibility form the audio p.a. is to move it underneath one of the front seats (not recommended, I know, as it could interfere with running the seat positions to their extremes. But, the audio p.a. shouldn't generate much rf!

I made a simple plywood shelf/cover that sits over the 901 and has the floor mat on top of it, so it sort of blends in (and lets my 3 year old climb into her seat without having to step on the 901). In a pinch this technique could handle both the 901 and the 706.

Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amateur.equipment,sci.electronics.equipment,sci.electronics.misc

A friend of mine bought a Korean War vintage Sniperscope (P.O.#27-43200-03, dated 6/23/51) at a garage sale. It is missing the power pack which supplies 20kV for the image tube and some lower control voltages. It uses the newer image tube, the number of which I have forgotten.

I am trying to help him find (1) a manual, schematic, or any other information on this piece of equipment, and (2) a power pack, or plans for one, or at least specifications so we can design one ourselves. Any assistance will be greatly appreciated.

I will try to monitor these groups, but if you can copy me by email also it will help. Thanks very much.

Bill,

Yes this is very annoying and I have not found a way around this. You have not missed anything that I haven't so at least there are two of us that have this problem. This is one reason why I'm eargerly awaiting my sevice manual for the rig from Icom. I'm glad I didn't hold my breath, since I've been waiting since December of last year. But hey, I waited since Nov 95 for the Z1A serv manual and it arrived yesterday. So maybe the 2350H one will come soon too!

If I can find a program/hardware mod in those manuals I'll let you know.

4859. Retuning a Kenwood TM731A

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-29 00:00:00 UTC
From: n9jig@TheRamp.net
Message-ID: <n9jig-2906960027290001@mund-ip-4.theramp.net>
Source record: 198888

I would like to retune my Kenwood TM731A to receive from 440 to 480 MHz. It currently will receive from 400 to 455 MHz, but will display up to 499 MHz. Is there a way to move the window up? My agency uses freqs in the 470-476 range, and I'd like to monitor them in the sub-band...

BTW, I found that it will transmit (into a dummy load of course...) 400 to about 468 MHz. While I really don't care if it will transmit any higher, it would be interesting to see if the same retuning affects this.

I have a 2350 and never consider this a bug. I thought that this was to
enable you to minitor another machine or freq. while you were enjoying
yourself in a different location. My Icom W21AT work the same. In the
cases where this actually bothers me, I turn down the volume on the sub
reciever.

The FCC does not check the transmitter of any Amateur radio, it only need to meet Part 97 rules. The Amateur Radio which has a receiver that operates above 30 MHz is actually approved under FCC Part 15 as a scanning receiver. Check the FCC ID AFJIC-2350H and see what the FCC database brings back.
All your habdhelds and mobiles that operate above 30 Mhz are approved as scanning receivers. The operator interface is not subject to any rules either.

Now for many years the sub band audio is available when transmitting in the main band otherwise how would you accomplish full cross band duplex operation. You can not operate full duplex if you can't hear the sub band while transmitting on the main band. The sub band mute will shut off the sub band audio when enabled, it does however give a beep if you want that indication. The service manual will not show nor have any of the CPU programming. It will only show what the ports of the CPU do.

Our RACES organization has a replacement repeater but the ordering agency forgot to order the cable. Here's the e-mail I got from my Communications Officer:

" I have good news and bad news. Good news is, UHF repeater is here! I have it in my hot little hands. Corp. sponsorship is great! Bad news is corp. never ordered programming cable ($55 option). Looks like the computer to repeater is just a rs232 connection. I wonder if it would be possible for you to search the net in radio tech sections to see if anyone has any information on this cable before I attempt to reinvent the wheel. I believe I know what's going on from looking at the schematics and I have all the nesessary connectors BUT I would appreciate it if you could check for any confirming information brfore I attempt it. Here's the dope....The repeater is a VERTEX VXR-5000 (made by Yaesu Munsen). The VERTEX (Yaesu) part number for the cable is VPL-1"

If you have any info on this, You can e-mail me at mouse@ag.net or
The C.O. Don Burrows KO2J at ko2j@juno.com.
Thanks loads for the help and 73's with Gud DX!!!

Victor,

I have no clue where you got the idea that HRO is selling the FT-51 and the FT-50 for the same price! I just looked at their on-line pricing database at their web site. The FT-51 is selling for $479.95 for 2 watt version and $519.95 for the 5 watt version. The FT-50 is selling for $329.95 for 2 watt version and $339.95 for the 5 watt version. These prices are obviosly not even closely the same! Please check you information for accuracy prior to posting. The FT-50 is definitely worth the money for waht it does. 73

>
etc.

The U.S. National Telecommunications and Information Adminstration, in their recent spectrum requirements report, states that worldwide Amateur radio growth is 7% per year. So Amateur radio is growing, not declining. I would agree though that *relative* to other radio communications services, primarily "cellular" radio telephone and its rapid growth, a 7% growth rate is a slow growth rate.

>KC7PMQ

This is NOT true. Bill Gates and Craig McCaw were founding investors in a company called Teledesic. Teledesic is getting allocations at 28 GHZ for high speed satellite data access (digital voice, video, internet data, whatever - its all bits). They have no involvement that I am aware of in LOW earth orbit (LEO) satellites for 2-way short messaging of the type that the LEO providers wish to offer.

I am an employee of Microsoft Corporation and the above statements represent my personal opinion and are not necessarily those of my employer. Besides who else would ever accept credit for my silly opinions?

I built one about 2 weeks ago... A real nice kit... The receive side it real hot... It takes about 10-12 hours to build it.. The power meter that I used, normally tight, showed it put out 12.5W if I peaked it for the lower part of the band, but it's about 10W across the whole band.. The only Mods I plan on making are 1 for Ext. PTT, I noticed a little chop on some low audio peeks (SSB) and the bring out 12V out when the unit is switched on to drive a Ant. relay.. This unit doesn't have any kind of Ant. bypass on it.. I did work a guy just before the June VHF contest with on and it really sounded good... Pete n2mci@mhv.net

Buckets of sulfuric acid? Where'd this come in? If you somehow got the acid to spill on someones hand, while they're in the act of stealing it, do you think they'd be smart enough to sue you? Its a possibility, but a statement like " While I was stealing this guy's radio, this acid poured all over me... " doesnt really hold well.

That seems to be the consensus of just about everyone...However, where I work, we have programmable UHF and VHF radios that are in use, and they are (or must be...) type accepted...The radios that I am thinking about are made by Fujitsu 10, and the manuals even say that they are designed for 150-xxx, and 450-xxx operation...Again, they are programmable from the panel...

Any idea how they got around that one?

Yes, I have one. I don't have my license yet, so I can't speak for it's TX features, but the receiver is really something. Super radio, with real nice display! The only complaint I have is if I mount in where I want to, I can't view the LCD display, because, like most, it's optimized for viewing from above, at about a 45 degree angle. I want to mount it on the front of my console, vertically, and view it from about a 30 degree angle from below. At that angle, the display is invisable. This is not a fault of the FT-8000, any LCD display would have this problem.

From: Joe Fitter BV/N0IAT <joentam@transend.com.tw>
Message-ID: <31D6E595.2028@transend.com.tw>
Source record: 198623

Hi,
After receiving 5 or 6 comments regarding the use of the IC-706
with a desk microphone to improve the loud but tinny audio, the
concensus from usenet was as follows:

1. Change to a SM-6 microphone
2. Throw away the HM-103 stock hand microphone (which is junk)
3. The audio is an inherent characteristic of the 706 -- deal
with it or trade for another rig.

Just thought you'd like to have a summary of comments from my
fellow users on the net.

Source record: 198624

Hi,

I've seen a lot of talk about DSP filters lately. Has anyone
done an extensive review of these filters that is available
via internet? Not really concerned about DSP on TX...mostly
just on RX.

Does anyone have some recommendations on which one is best
from a cw-op perspective? I assume CW is easier to signal-
process than phone, so, I guess a less expensive unit would
suffice for my type of operation.

Comments or opinions?
Thanks,
Joe

Are you saying that whatever is heard through the speaker coming from your sub band is retransmitted out through the microphone via acoustic coupling? Why would you think that is a bug? That is very normal for most dual band radio's I've seen. I suppose some of them may have sub band mute when you are transmitting on the main band, but I know that a lot of them don't have that feature.

Why not have your mic gain checked/deviation checked, try moving the speaker, and turn down your sub band audio a bit. I'm sure that you would be able to find a happy comprimise of mic gain, sub band audio, and speaker location that will work for you.

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.misc

Allright! Having seen this quote too many times the last week,
I'll toss my 2 cents in:

>>In a June 10 open letter to the Amateur Radio community, Kenwood's
>>Amateur Radio Products Group National Sales Manager Paul Middleton,
>>KD6NUH, painted a dismal picture. "When we looked at where Amateur Radio
>>is today, and where it is going to be in ten years at the present rate
>>of decline, the future looks bleak," he wrote, citing competition from
>>unlicensed communications modes. (internet).

Not! Amateur Radio specifically has to do with the 'science' of
communications and experimentation with RADIO.

RADIO, by definition, is an integral part of Amateur RADIO.

It is a fallacy to assume that those who communicate via Internet
might have otherwise become Amateur RADIO Operators.

Mr. Middleton is merely the most recent example of individuals
who over the last fifty years or so have pointed at a similar
technical hobby and erroneously predicted the demise of Amateur
Radio.

Kenwood is welcome, in my book, to sell its radios in every
retail establishment from K-Mart to Victoria's Secret, if that's what
they want to do, but they can kiss me off as a customer.
(Oops, they already have- I'm using the Internet)

Mike Royko,a national newspaper columnist once said something like,
"...in spite of predictions, there's no way computers and the Internet are going to
replace the daily newspaper until a PC is just as easy to use and read
in the bathroom..."

Carry on, Sons of Marconi!

Brian, I've had one for about a year now (Cheese and crackers, is it
that long already?) and I like it. I run it mobile, have the
straight key and a paddle mounted side by side on a board that sits
atop the arm rest. Works okay for me. Full break-in took a little
getting used to, but it's fun once you get the hang of it. The
"Jones" filter seems to be a continuously variable IF filter that
runs from about two and a half kHz to below 500 Hz in width. You
can lose a guy with a filter that sharp if you're not careful. RIT
works well. Morse keyer comes on at 25 wpm, you adjust it up or
down from there. No keyer speed memory; next time, it will be back
at 25 wpm again.

4905. HELP!! building my own 2 m mobil antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-30 00:00:00 UTC
From: anarchyu@olywa.net
Message-ID: <31d613de.4335662@news.olywa.net>
Source record: 198681

Howdy..

I want to build my own 2 meter antenna for my handheld radio which i will be using in my truck.. I am on a extremly tight budget (i mean i have like 20 bucks i can spend) i have a bunch of connectors and such that i have from a antenna i made that plugs right onto my radio and that works great, but doesnt work great when i am driving. I have a large rectangular magnet (which i can cut to size) for making it magnet mountible. If anyone has an IDEA or drawing or something they can send me that may help, PLEASE e-mail me at KC7QZR@olywa.net and tell me!!

I also have a supply (60 feet or so) of 12 gauge copper house wire (new never used) if that would work for part of the antenna.

Thanx for any help you can give!!

Brad

Just a general observation. This thread appears to tell us a lot
about the US licensing standards. In 40+ years I have never seen
anyone having a problem with a simple dipole or the underlying basic
principles. What has really made me comment is the pattern of very
elementary questions which appear on the net frm licencesed hams. I
accept thar Chris may not be a ham and certainly this comment is not
critical of him.

If you want a basic issue 2m mobile, you may want to look into the ADI
2m mobile for ~$250. Are you sure the RS mobile is that low? Last
time I saw a RS catalog it was well over $300.

I am hoping someone on this newsgroup can help me. I have a Shipmate 8200 shipmate VHF marine radio that is 4 years old - although it has only been install less than two years. Due to space limitations on my boat, it is about the only model that I can use. I believe the radio was manufactured by Robertson (a Norway company) that was since bought out by Simrad. I live in Bermuda and there are no dealers of repair services here that have any knowledge of this radio, including schematics diagrams etc. Can anybody out there reccomend a company that is authorised (or expierenced) in the repair of these radios ?

The local techinitions tell me that the output power is o.k. but that there is so much background noise on both the receive and transmit function. I have tried different antenna and different locations but the problem is the same. I have had the radio checked for solder joint problems, disconnect/corroded wire and other obvious problems - but everything checked out o.k.

I would really appreciated any help you can give me.

Have a Great day !

No!
Head down to your local music instrument shop and look at the
graphic/paramertic equalizers, and then look at some inexpensive
studio/band/recording microphones. When you wire up a good EQ with a
decent mike into your transceiver you are now able to shape ,contour
and adjust audio frequency bandwidth to your voice and make the audio
that you like. You'll have one set of adjustments for that deep
rag-chewing HiFi sound and one set for that DX "Lazer Audio".

Check the activity on 14.178 in the mornings between 7-9 AM ESTand see
for your self.

We have very little choice when it comes to pre-audio equipment in the
amateur ranks, everybody turns to Heil, because its the only show on
the block. But if your into audio they bring very little to the
table!!

Good Luck,
Billy

Great radio!
But has anybody figured out how to adjust the audio frequency on the
two included voice equaliziers. If you could tailor the eq's for the
individuals own voice you would have the best of all worlds!!

I have had a Heil BM-10 for a number of years. That is the old style with the low profile foam earphones. A couple of years ago someone brought the new proset to field day and I used it there. At Dayton this year I finally purchased a pair of my own and used them this field day for hours on end. They are the most comfortable pair of headphones that I have ever worn which is especially important during a contest. I have always had good audio reports with the Heil mic elements as well.

Yes, they are pricy, but I don't regret it.

Mike

1) There is enough blame for everyone.

2) What can we do to end this stupidity?

3) Putting all of the rhetoric to the contrary aside, isn't it a fact
that since the very beginning, human beings *LOVE* to go to war?

4930. 45$ for a mod on IC706 !

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-30 00:00:00 UTC
From: ea4abb@ea4rct.CLubs.etsit.upm.ES

Source record: 198706

Hello everybody, many thanks for reading this mail.

I purchased some months ago an ICOM IC-706 but I cannot use it because with my licence I only can use it on VHF band, so I need to modify it. I carry my transceiver to my customer and they said that if I want to modify it I need to pay 45$, a lot of money...

A man said that I can disconnect the PL-259 from the rear of the radio but I think that perhaps there is a better way to mod it...

Any comments are welcome !

Dave,

I have a pair of JT-1000's that I use for SAR. Nice units.
Mail me, I'd be happy to give you specs and opinions.

Ed, do they give any figures for amateur radio growth in the U.S. ?

Bill,

Where did you get your FT-8000?

Interesting. Thanks for mentioning it, Stephen. I hadn't noticed the FT-8000 announcement, either. Interesting that the http://www.yaesu.com/ft8000.html web page mentions FT-8000M (M suffix) while the price list at http://www.hamradio.com/search/adv.html mentions FT-8000R (R suffix).

I don't have any more information about that radio, but if it really does receive 110~550 MHz and 750~1300 MHz, including the 1.25m, 33cm and 23cm bands, then that makes it quite interesting. Perhaps sensitivity would be low in those other three bands.

I'm still guessing that an FT-9000M radio will come out -- a radio like the FT-3000M, with high 70W output power and remote controllability, but which can transmit on 70cm in addition to the 2m band. Hope so.

4935. Want to crypt my Fm tranmissions

Hi Bob,
Send me an SASE and I'll copy the 2 benchmark articles on the subject. Als
have the NH co that does conversions. There is not much to it. I have 3
200's here that I was going to do but came up w/ a 1/4 SS KW instead.
